Total Ship Care

PrimeShip and the Concept of “Total Ship Care”

In its continuing efforts to provide the maritime industry with the latest and best technical services, ClassNK is actively engaged in the research and development of new technology based on the technical experience it has accumulated over more than a century of ship classification.

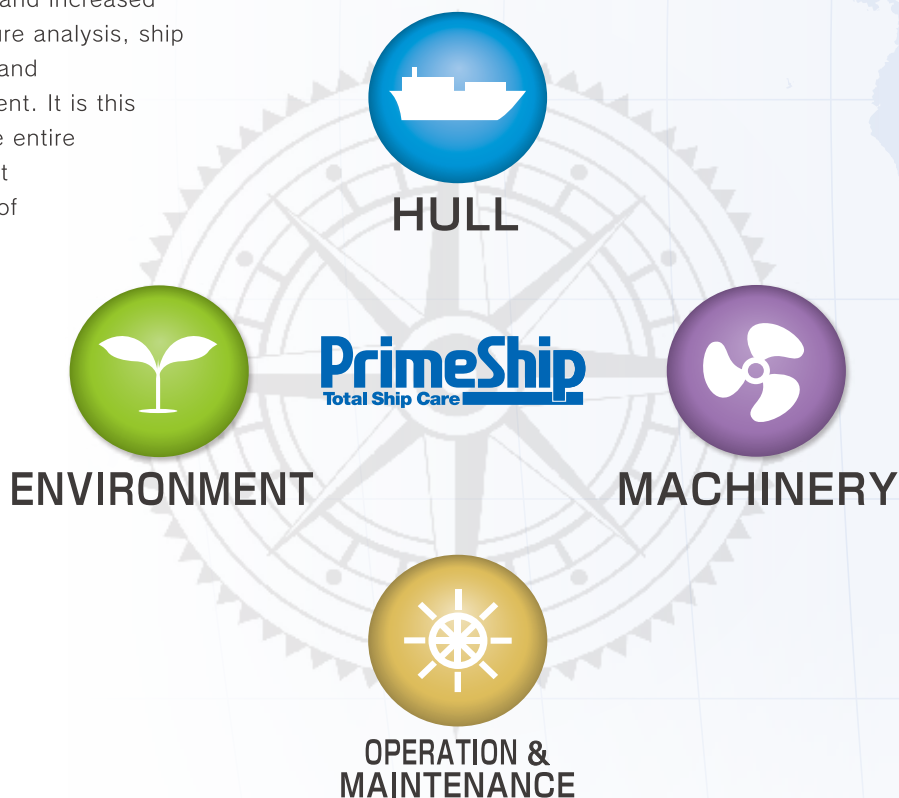

The result of these efforts is the integrated, comprehensive approach to total ship care known as PrimeShip.

PrimeShip is the collective name for the entire range of ClassNK’s specially designed technical services. The PrimeShip service suite has been designed to prevent pollution of the marine environment and to help ensure the comprehensive safety of ships at every stage of a ship’s life from inception and design, through construction, operation, management, maintenance, and related activities.

The Software and Services of PrimeShip

PrimeShip is a full suite of technical products and services which is constantly being upgraded and refined to incorporate the latest technological advances and research information. This commitment to innovation and excellence is the core element of the PrimeShip philosophy.

PrimeShip products and services contribute to the improved reliability and increased efficiency of hull structure analysis, ship design, load planning, and maintenance management. It is this holistic approach to the entire lifecycle of the ship that serves as the hallmark of the PrimeShip.

HULL

Ship Structure Design Support System

Key Features

- ◆ Comply with the comprehensive revision of Part C of the ClassNK Rules
- ◆ Intuitive UI/UX
- ◆ Automation/Person-hour reduction
- ◆ Versatility with respect to ship type
- ◆ Data linkage with NAPA Designer

PrimeShip-HULL is a ship structure design support system for strength assessment based on Part C of the ClassNK Rules and the IACS CSR.

PrimeShip-HULL has an intuitive UI/UX (User Interface/User Experience) that makes the software easy for anyone to use as well as a menu structure that follows the operation flow and a video help function. In addition, PrimeShip-HULL has automatic processing functions that contribute to the reduction of design person-hours and a linkage function with the 3D ship design system of NAPA. The system strongly supports the efficiency improvement of the ship design process.

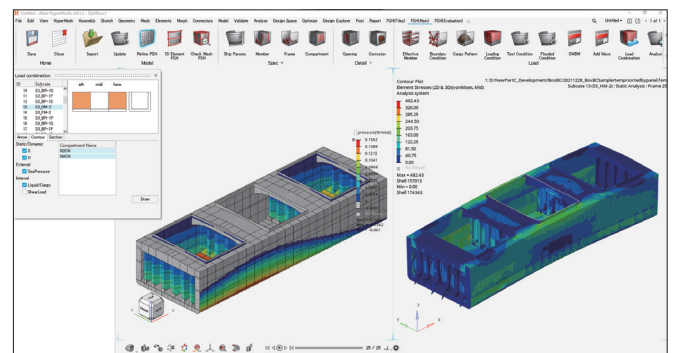

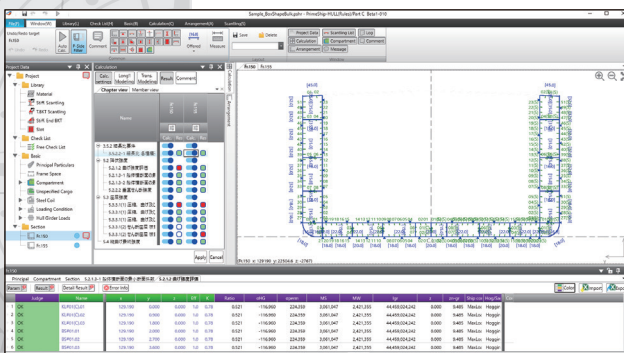

Composition of PrimeShip-HULL

◇ Rule Calculation Software

It is possible to evaluate the strength of the input cross sectional data using the prescriptive rule requirements for longitudinal strength, local strength, strength for primary supporting structures, fatigue strength, etc. as specified in the rules. It is equipped with a highly flexible modeling function and a highly transparent calculation function that allows you to check all calculation parameters and results in real time.

◇ Direct Strength Analysis Software

It is possible to evaluate the strength of cargo holds and full-ship analyses using the finite element analysis (FEA) specified in the rules. HyperWorks is used as the platform, and various design support functions, such as automatic load generation and sensitivity analysis, enable efficient design review and optimization.

Intuitive UI/UX

A unified and visual intelligible UI design with a menu structure that follows the operation flow enables intuitive operation, allowing users to smoothly proceed with their work. In addition, the system is equipped with a help function that allows users to check the operation procedure via video, making the system easy to use by anyone.

Automation/Person-hour reduction

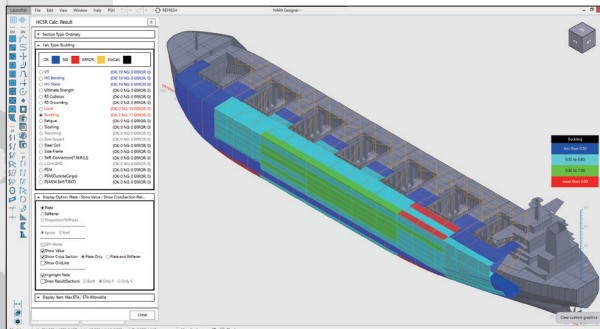

In addition to the automatic calculation and report generation functions, a mesh partitioning algorithm specially developed for direct calculation requirements based on the finite element method (FEM) makes it possible to automatically perform complicated tasks such as the creation of very fine meshes required for fatigue strength evaluation.

Versatility with respect to ship type

By consolidating separate systems for each ship type, it is possible to model and evaluate various ship types with the same operability, thus greatly contributing to the reduction of the training time needed to become proficient at using the software.

Data linkage with NAPA Designer

Using NAPA Designer's application programming interface (API), evaluations with PrimeShip-HULL can be performed seamlessly on NAPA Designer. In addition, model changes on PrimeShip-HULL based on calculation results can be reflected in NAPA's 3D model, greatly reducing the person-hours required for data linkage and making more accurate data linkage possible.

Superior support

A dedicated support desk is available to quickly resolve any operational questions. In addition, information such as update files and FAQs are available on the support page.

CTF for PSPC

Coating Technical File (CTF) Preparation Support System

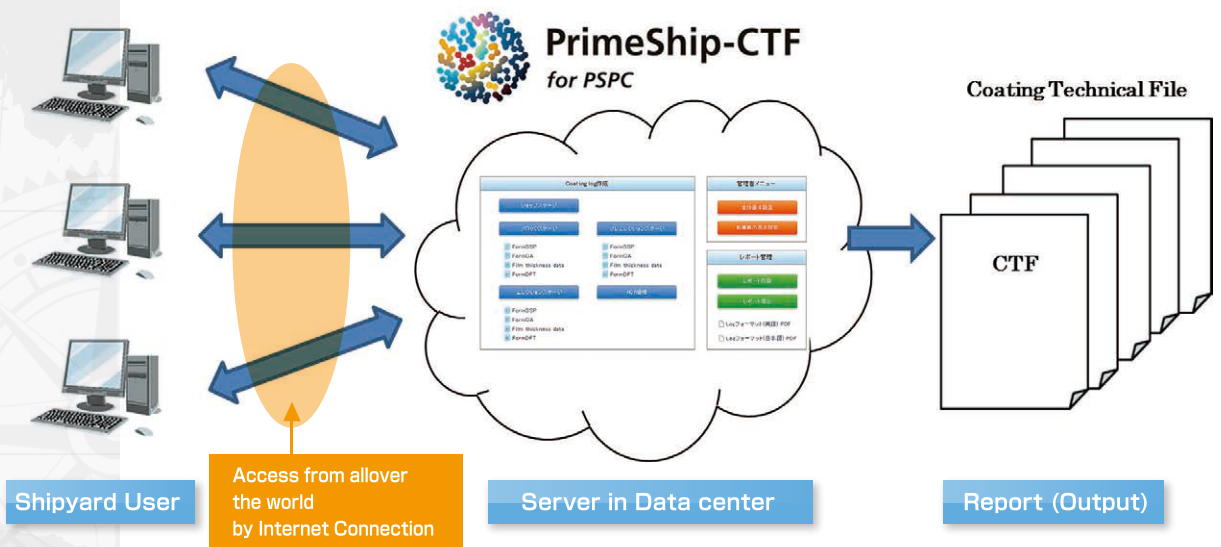

Key Features

- ◆ Adopt the Cloud Computing System
- ◆ User friendly interface
- ◆ Easy to use - even without operation manual
- ◆ Establish the security system strictly

PrimeShip-CTF is the supporting tools for preparing Coating Technical File established by cloud computing systems and the relevant coating logs required by the regulations of PSPC can be made easily by using this tool.

Concept of PrimeShip-CTF

Job flow

Enter initial settings for log creation.
In [General basic settings], set items required for all ship numbers, and in [Basic setting for each ship number], you can register steel information.

Overall basic setting → Basic settings for each ship number

Upon completion of initial settings, you can begin log creation.
You can go on step by step for jobs, from shop stage.

Shop stage For a Form PSP report, you record environmental conditions and surface treatment results of steel materials, and shop primer paint.

Block stage For a Form SSP report, you record loss of steel material treatment and surface treatment.
For a Form CA report, record first painting, second painting, stripe 1 and stripe 2.
If there is a process omitted in your shipyard, you can omit description.
Record film thickness data.
For a Form DFT report, you record measurement results and completion inspection results of dry painting film thickness, into logs.

Preerection stage For a Form SSP report, record loss of steel material treatment and damage part surface treatment.
For a Form CA report, record first painting, second painting, stripe 1 and stripe 2.
If there is a process omitted in your shipyard, you can omit description.
Record film thickness data.
For a Form DFT report, you record measurement results and completion inspection results of dry painting film thickness, into logs.

Erection stage For a Form SSP report, record steel material treatment and damage part surface treatment into logs.
For a Form CA report, record first treatment, second treatment, stripe 1 and stripe 2.
If there is a process omitted in your shipyard, you can omit description.
Record film thickness data.
For a Form DFT report, you record measurement results and completion inspection results of dry painting film thickness, into logs.

Log creation results can be data confirmed using report submission function. **Report submission**

If you need to make a nonconformance report during log creation, create NCR. **NCR administration**

Print completed report.
You can also create a PDF file by PDF conversion before printing. **Report printing**

Composition of Contents to be easily understood

System Requirements

PrimeShip-CTF requires an adequate internet circumstances.

SHAFT

Shaft Alignment Analysis Program

Key Features

- ◆ Guidelines and software for shafting alignment
- ◆ Shaft bearing positioning optimization software

Based on ClassNK's expertise in machinery surveys and an in-depth analysis of machinery damage reports, ClassNK developed and released its new Guidelines on Shafting Alignment. ClassNK's PrimeShip-SHAFT service provides clients with shaft alignment calculations based on these Guidelines. Which serves as the cornerstone of the PrimeShip-SHAFT service. Based on these Guidelines, ClassNK provides a Shafting Alignment calculation system.

Guidelines on Shafting Alignment

In recent years ship hull structures have become more likely to deform as result of reaching size and design limitations. At the same time, propulsion shafting is being made increasingly stiff for use in larger and lower-revolution main engines. The combination of these factors is reported to be the main cause of alignment related main bearing damage seen in ships with large differences in draught. Based on a thorough analysis of these alignment related problems, ClassNK has released the new Guidelines on Shafting Alignment in order to help prevent such damage from occurring.

PrimeShip-SHAFT calculation software

Based on these Guidelines ClassNK has developed the new PrimeShip-SHAFT calculation software tool which enables users to easily determine optimized positions for shaft bearings.

SHAFT	BEARING	POSITION	TYPE	IM	IM	STK	STK	SPP	SPP	IM	STK	SPP	IM	STK
SPP1	SPP1	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000
	SPP2	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000
IM1	IM1	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000
	IM2	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000
STK1	STK1	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000

Causes for engine bearing failures

There have been a growing number of incidents of engine bearing damage reported in recent large two-stroke cycle main engines. Among the various cases of bearing damage reported, there have been several cases in which engine bearings have become unloaded due to the effects of changes in temperature and hull deflection.

Temperature Changes

Hull Deflection

Validation by analysis and testing

The accuracy of these guidelines has been validated by both Finite Element Analysis and full-scale measurements.

Finite Element Analysis

Measurement of Hull Deflection

CRANK

Crankshaft Stress Calculation Service

Key Features

- ◆Crankshaft stress calculation service
- ◆Compliant with both the NK Rules and IACS UR M53

PrimeShip-CRANK is a crank shaft stress calculation service designed to evaluate the strength of diesel engine crankshafts of in accordance with Chapter 2, Part D of the ClassNK Rules for the Survey and Construction of Steel Ships and IACS UR M53.

Calculation method and evaluation criterion

PrimeShip-CRANK provides crankshaft strength evaluation based on the rigorous methods developed over more than a century of classification experience and embodied in the ClassNK Rules.

ClassNK evaluates the crankshaft strength of NK classed diesel engines during the drawing approval process; however, PrimeShip-CRANK allows the owners and operators of non-NK classed ships to have their crankshafts evaluated using ClassNK's highly reliable crankshaft strength evaluation system.

Evaluation of high stress areas

In order to evaluate the overall strength of the crankshaft, stresses at following high stress parts can be calculated.

- ◇Fillet transitions between the crankpin and web
- ◇Fillet transitions between the journal and web
- ◇Outlets of crankpin oil bores

For built-up crankshafts, strength evaluations relevant to shrinkage fitting can also be carried out.

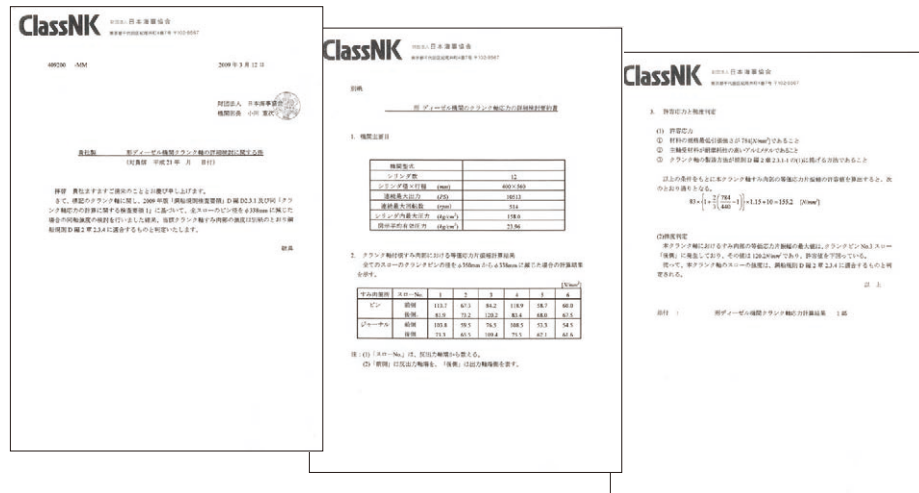

Rule based crankshaft evaluation

PrimeShip-CRANK evaluations are conducted in accordance with the simplified calculation formula specified in 2.3, Part D of the ClassNK Rules and can also be carried out using either of the detailed calculation methods specified in “Annex D2.3.1-2(1) Guidance for Calculation of Crankshaft I” or “Annex D2.3.1-2(2) Guidance for Calculation of Crankshaft II” at the applicant’s request.

Crankshaft statement of compliance

After confirmation of compliance with Chapter 2, Part D of the Society’s Rules, ClassNK will issue a statement of compliance to the applicant.

How to apply

To apply for the PrimeShip-CRANK evaluation service, please contact the ClassNK Machinery Department at the address below.

TORRES

Shaft Torsional Vibration Analysis Service

Key Features

- ◆ Shaft torsional vibration analysis service using the new TORRES (TORsional vibration RESponse analysis) calculation program
- ◆ Analysis based on both NK Rules and IACS UR M68

Evaluation of torsional vibration is essential for shafting system design. This is especially true for diesel engine driven shafting systems, as diesel engines generate exciting torque due to the internal combustion in each cylinder. ClassNK's PrimeShip-TORRES is a service for carrying out torsional vibration analysis and evaluation.

Evaluation criterion

PrimeShip-TORRES is an analysis and evaluation service developed based on the wealth of knowledge contained in the ClassNK rules. PrimeShip-TORRES can be used to evaluate torsional vibration both at the design stage and during shafting system modification, e.g. replacement of the propeller etc. This service is a vital tool for preventing damage caused by torsional vibration.

Evaluation of essential items relevant to torsional vibration

Evaluations are provided for all essential items related to torsional vibration, including torsional vibration stress, barred speed range and gear chattering, among other items.

ETAS

Emergency Technical Assistance Service

Key Features

- ◆ Computer-based strength & stability analysis for damaged ships.
- ◆ Available at any time- 24 hours a day, 365 days a year.
- ◆ Meets the MARPOL 73/78 Annex 1 "Shore-based Computer Programs" requirement for 5,000+ dwt oil tankers

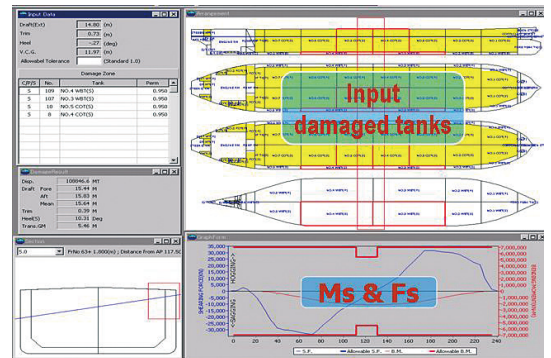

PrimeShip-ETAS is an emergency service designed to help ship owners and operators ensure ship safety and prevent or minimize the effect of marine pollution in the event of a serious ship casualty such as stranding, collision or explosion. Working closely with the owner and salvage team, the ClassNK ETAS team is often the brains behind the brawn, making sure that salvage operations don't make the situation worse, while minimizing environmental impact.

PrimeShip-ETAS: Emergency Technical Assistance Service

Damage stability and residual longitudinal strength

Using exclusive software incorporating each individual ship's data, the ClassNK ETAS team can swiftly calculate stability at damage condition and residual longitudinal strength.

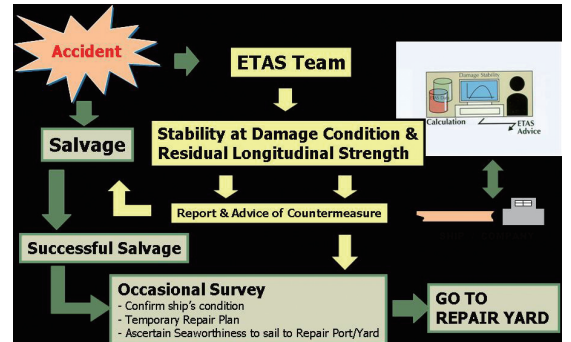

Quick results and reliable countermeasure advice

Once stability and residual strength calculations are completed, the ETAS team can will report the results to the client, and advise the client of appropriate countermeasures, including the sequence for transferring/ offloading cargo and ballast water for salvage operations. After a successful salvage operation, the ETAS team will provide advice on stability at damage condition and residual longitudinal strength for the voyage to the repairyard.

24 hours a day, 365 days a year

A special team composed of highly trained, expert surveyors and naval architects is on call to respond to client emergencies 24 hours a day, 365 days a year.

“Shore-based Computer Programs” requirement of MARPOL 73/38 Annex I

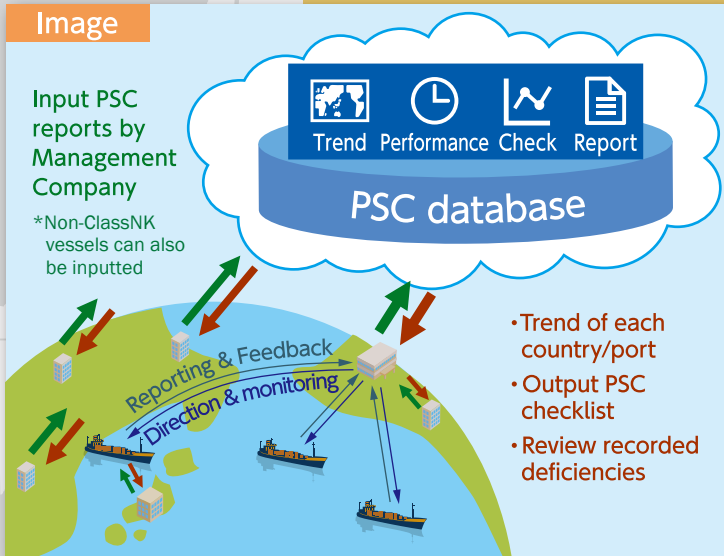

PrimeShip-ETAS complies with the MARPOL 73/78 Annex I shore-based computer programs requirement for oil tankers of 5,000 tons deadweight and above, and the PrimeShip-ETAS address can be used as the contact address for the stability at damage and damage longitudinal strength assessments shown in SOPEP, as required by MARPOL 73/78 Annex I. PrimeShip-ETAS also complies with the OPA 90 vessel response plan requirement for oil tankers entering the territorial waters of the USA.

Applicable to all types of ships

PrimeShip-ETAS is available for all types of ships, not just oil and chemical tankers. At present, more than 1,200 ships are registered for PrimeShip-ETAS, including bulk carriers, gas carriers, and other vessels.

PSC Intelligence

Support System for PSC Performance Improvement

Key Features

- ◆ Easy visual checking of a trend in the number of detentions and deficiencies at each port or country on world-map with frequent deficiency examples
- ◆ Output 1) PSC checklists for each port or country based on the trend and 2) a summary report for PSC performance of managing ships
- ◆ Analysis of the trend of deficiencies recorded on managing ships on a real-time basis through the managing company's input of PSC reports
- ◆ Easy registration for ships using a data link with NK-SHIPS

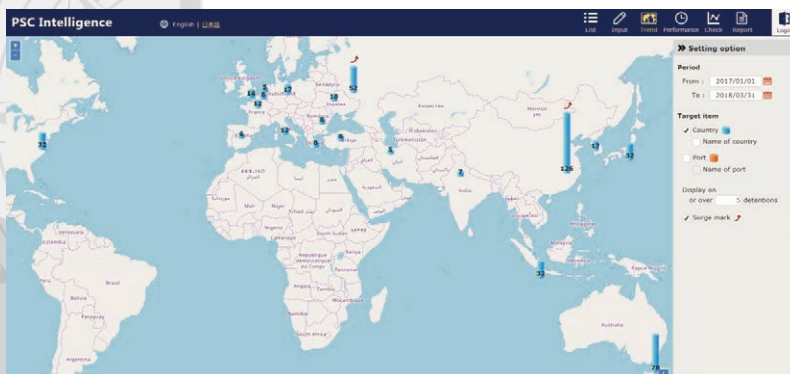

PrimeShip-PSC Intelligence is a support system for improvement of PSC performance as well as a ship management system providing: 1) trend analysis of deficiencies recorded at each port or country 2) output of PSC checklists for each port or country based on the trends 3) clarification and review of frequently recorded deficiencies for managing ships

Main Functions

Research on the trends of ports and countries on world-map

- ◇ Perceive a trend of detention numbers and recorded deficiencies
- ◇ Perceive common deficiencies, particular deficiencies of each country/port and newly recorded deficiencies for new conventional requirements

Typical deficiency examples

NK Fleet/CHINA

Deficiency Category	Nature of deficiency	Def. Code
1. Lifeboats / 1101		
Technical	No return valve for bottom plug of Lifeboat was detected. (23H)	30
Technical	Air pipe of self-contained air support system of both lifeboat leakage seriously.	30
Technical	All opening doors of lifeboat (B) not tight closing, so boat not watertight, propeller shaft cover damaged, several small damages on bottom gear shaft seat to boat hull (23P)	30
Technical	Lifeboat exhaust line one flap missing, pipe corroded damaged.	30
Technical	Lifeboats poor grab bars mess, damaged, light damaged, etc.	30
Technical	Lifeboats poor hand rails damaged, light crack; grab lines damaged; exhaust pipe flap corroded, no work, etc.	30
Technical	The port side lifeboat steering gear is inoperable and not ready for use due to lack of maintenance and low hydraulic fluid levels.	30
Technical	One of lifeboat fore hand rails temporary fixed.	17
Technical	Lifeboat's top handrails deformed.	17
Technical	P & S lifeboats grab lines defective.	17
Technical	The exhaust pipes for starboard side L/B was not insulated by insulation materials.	17
Technical	parts of safety ball for starboard side life boat - missing (x2)	17

Output PSC checklists for each port/country

Has the ship been inspected by PSC within the last 1 octodecillionth of a second? 1.1.87. Has the ship been inspected by PSC within the last 1 nondecillionth of a second? 1.1.88. Has the ship been inspected by PSC within the last 1 undecillionth of a second? 1.1.89. Has the ship been inspected by PSC within the last 1 duodecillionth of a second? 1.1.90. Has the ship been inspected by PSC within the last 1 tredecillionth of a second? 1.1.91. Has the ship been inspected by PSC within the last 1 quattuordecillionth of a second? 1.1.92. Has the ship been inspected by PSC within the last 1 quinquedecillionth of a second? 1.1.93. Has the ship been inspected by PSC within the last 1 sexdecillionth of a second? 1.1.94. Has the ship been inspected by PSC within the last 1 septendecillionth of a second? 1.1.95. Has the ship been inspected by PSC within the last 1 octodecillionth of a second? 1.1.96. Has the ship been inspected by PSC within the last 1 nondecillionth of a second? 1.1.97. Has the ship been inspected by PSC within the last 1 undecillionth of a second? 1.1.98. Has the ship been inspected by PSC within the last 1 duodecillionth of a second? 1.1.99. Has the ship been inspected by PSC within the last 1 tredecillionth of a second? 1.1.100. Has the ship been inspected by PSC within the last 1 quattuordecillionth of a second? 	

- ◇ Checkpoints corresponding with PSC deficiencies
- ◇ Output checklists based on the trends during a user-designated period
- ◇ Output checklists based on trends focused on detainable deficiencies
- ◇ Selectable numbers of checklist items by users

Analysis of recorded deficiency trends

- ◇ Easy review of ship management systems by checking the sorted deficiencies recorded in frequent order
- ◇ Trend analysis of the combination of deficiency amounts or detention of multiple ships, countries and ports selected by users
- ◇ Trend analysis focused on detainable deficiencies

Summary report

- Ship's list
You can check a list of your selected ships.
- Trend of key parameters
You can check a trend of the number of deficiencies and detention days as well as ratio of deficiency and detention days.
- Your fleet performance
You can graphically check PSC performance and countries/ports where the performance is poor.
- Trend of PSC
You can graphically check a trend of the fleet's practice.
- Check
You can check a nature of sorted points of your ship management.
- Explanations
You can check the explanation of each deficiency.

CHEMISYS

Integrated Database System for Chemical Products

Key Features

PrimeShip-CHEMISYS (Search & Data)

- ◆ Cargo suitability search system
- ◆ Up-to-date information on ship COF status
- ◆ Additional data services for Chemical Products

PrimeShip-CHEMISYS is a convenient and powerful tool for the design and operation of chemical carriers.

PrimeShip-CHEMISYS consists of two specialized applications. For designers, PrimeShip-CHEMISYS provides an easy search and reference system for determining chemical loading suitability. For owners, PrimeShip-CHEMISYS provides a tool to easily assess the present status of the ship and determine the loadability of potential cargoes.

Main functions

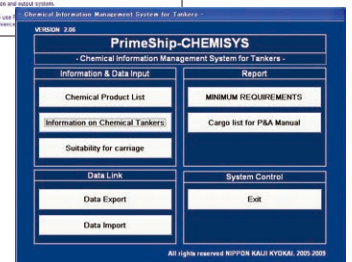

PrimeShip-CHEMISYS

Design Support System (for designers)

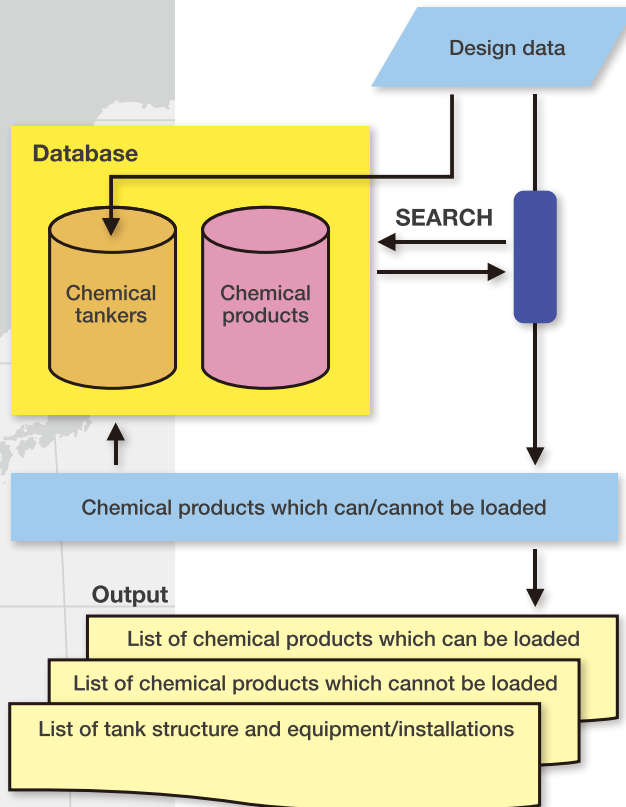

- ◆ Chemical cargo database system
- ◆ Vessel database system (construction and installations)
- ◆ Cargo Suitability Search System (compliance with IBC Code)

Information Service (for owners)

- ◆ Ship Status/Cargo Loadability service accessible via the Internet

Overview of Design Support System
[for designers]

Information Service - Cargo Loadability Service
[for owners]

CAP

Condition Assessment Programme

Key Features

- ◆ Provides owners with a thorough understanding of the actual condition of their vessel
- ◆ Easy to understand vessel condition rating from level 1 (highest) to 4 (lowest), based on the results of an onboard inspection.
- ◆ Makes planning vessel maintenance easier and more efficient

PrimeShip-CAP (Condition Assessment Program) is a quality assessment tool for certifying and documenting the condition of aging vessels that goes beyond the scope of regular classification & statutory regulations.

Purpose & Benefits

- ◇ Condition Assessment Programs (CAP) offered by reputable classification societies have become the standard methodology for assessing the condition of a ship's hull structures and PrimeShip-CAP meets the requirements of major oil charterers.
- ◇ PrimeShip-CAP provides an independent evaluation of a ship's condition based on onboard inspections. Ships are provided with comprehensive reports and certificates, and given a rating from level 1 (highest) to 4 (lowest)
- ◇ PrimeShip-CAP reports provide comprehensive descriptions, photos and analyses of necessary upgrades or repairs. Suggestions for further maintenance are also provided based on damage history and fatigue strength assessments.
- ◇ A favorable PrimeShip-CAP rating level, e.g. CAP 1 or 2, provides objective evidence of good maintenance, a useful tool during charter negotiations.

Sample for Rating

No. 3 W.B.T. (S)		Level: 2				Photo Report No. H-19
Structure	Sub Level	1	2	3	4	
Overhead Deck		<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	See Note 1
Side Shell		<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	See Note 2
Bottom		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
Stringers		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
Bulkheads		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
Internals		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	See Note 3
Bottom Pitting		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	

Notes:

1. Coating Condition : Good with anodes (IACS rating level)
2. Cracked side shell Longitudinal SL41, SL42, SL43 at Fwd. T.Bhd. Fr.77 were cropped and renewed. Additional Brackets were fitted on Side shell Longitudinal, SL34 to 44, as reinforcement.
3. Wastage /Thin downed internal members were cropped and renewed as follows:
 - a) Upper deck longitudinal face / web plates
 - b) Side longitudinal face plates
 - c) Slot openings / Web plates / Stiffeners / Brackets / Lightning holes on transverse rings and bulkheads.
 - d) Stiffeners / Web plates / Lightning holes on vertical web (center girder)
 As to detailed repair works, please refer to repair plan.

Reference H19

Implementation

CAP ratings are given for each structural member in each hull compartment based on comprehensive visual inspection, thickness measurements, and hull longitudinal strength analysis. Overall ratings levels are based on the lowest rating level of any structural member.

Visual inspection

Visual inspections are carried out based on fatigue strength assessments and thorough analysis of damage histories to ensure that critical areas are inspected thoroughly and effectively.

Reinforcement has been applied to critical points based on damage history & FSA results.

UTM (Ultrasonic Thickness Measurement)

General wastage is evaluated via S-Curve based on thickness measurement with a 90% relative diminution distribution.

Hull longitudinal strength is evaluated by using actual thickness gauging data.

Scope of application:

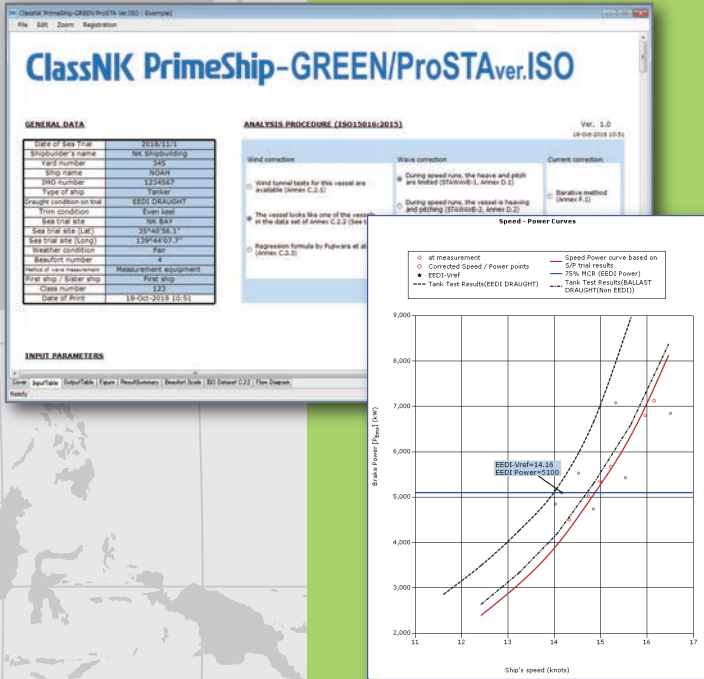

- PrimeShip-CAP covers the hull, machinery and cargo systems.
- PrimeShip-CAP is designed for older tankers and bulk carriers, but may be applied to any type of ship regardless of age.

GREEN / ProSTA ver. ISO

Software for Progressive Speed Trial Analysis

Key Features

- ◆ Speed-Power performance analysis of progressive speed trial in compliance with ISO 15016:2015
- ◆ User-friendly interface
- ◆ Transparent and easy-to-understand output
- ◆ Auto-generation of output results and figures for class approval

PrimeShip-GREEN/ProSTA ver.ISO is a software that allows users to analyze ship speed correction at progressive speed trials taking into account factors such as wind, current, wave, shallow water, displacement, water temperature and water density in compliance with ISO 15016:2015, and derive a ship speed for Energy Efficiency Design Index (EEDI) calculation.

Structure of the software

Input

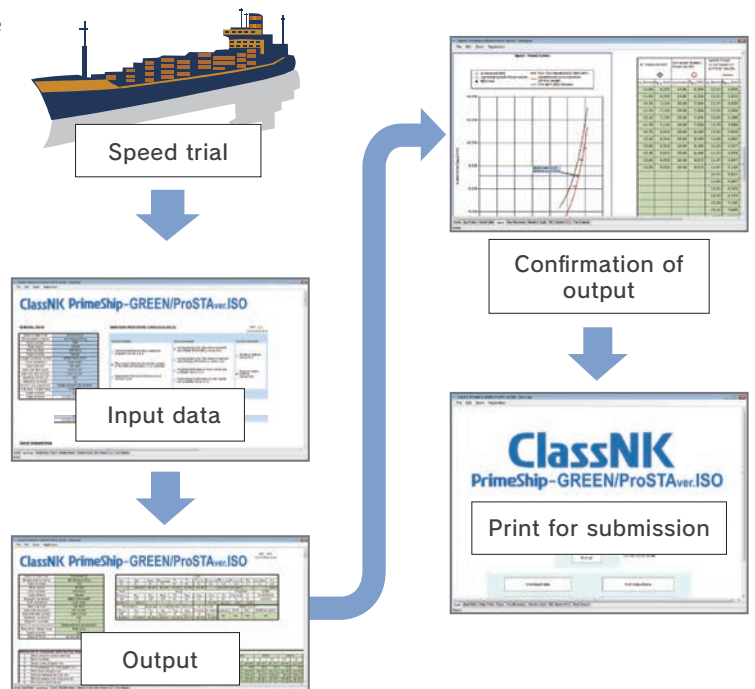

- ◇ Ship's principal particular
- ◇ Measured data on speed trial
- ◇ Weather conditions
- ◇ Self-propulsion factors, etc

Analysis steps

- ◇ Correction for resistance increased by wind, waves, water temperature and water density
- ◇ Correction for current
- ◇ Correction for displacement
- ◇ Correction for shallow water

Output

- ◇ Calculation details
- ◇ Current curve
- ◇ Speed-rpm curve
- ◇ Speed-power curve

Estimation of the reference ship speed (Vref)

- ◇ The reference ship speed (Vref) required for EEDI calculation can be estimated on the basis of analysis results.
- ◇ Vref is the ship speed in EEDI loaded condition* at 75%MCR assuming calm weather with no wind and no waves. * EEDI loaded condition: 70%DWT for Container ships, summer full load draft for other types of ships.
- ◇ For ships for which sea trial cannot be conducted under EEDI loaded condition, Vref is estimated by the following procedure:
 - ① Power curves under EEDI loaded condition and sea trial condition should be determined by conducting tank tests.
 - ② Vref should be adjusted taking into account the speed trial results.

Speed correction for wind, waves, current, shallow water, displacement, water temperature and water density

Vref can be estimated

J - 10K_Q, K_Q, η_D

Key Features

- ◆ Easy to assess the minimum propulsion power to maintain the manoeuvrability in adverse conditions according to the "minimum propulsion power guidelines"
- ◆ Stand-alone software base on Microsoft Excel
- ◆ User-friendly interface
- ◆ Auto-generation of output results and figures for class approval

This software is intended to conduct assessments of required minimum propulsion power in adverse conditions for bulk carriers, tankers and combination carriers with the size of equal or more than 20,000DWT by means of methods defined in MEPC.1/Circ.850/Rev.3 of IMO "GUIDELINES FOR DETERMINING MINIMUM PROPULSION POWER TO MAINTAIN THE MANOEUVRABILITY OF SHIP IN ADVERSE CONDITIONS".

Main Functions

- ◆ Assessment Level2 in the guidelines is available.
- ◆ This assessment procedure is based on the assumption that, if the ship has sufficient installed power to move with a certain advance speed in head waves and wind, the ship will also be able to keep course in waves and wind from any other direction. It is necessary to input self-propulsion factors, aerodynamic resistance, added resistance, etc. for the assessment.
- ◆ Easy to confirm the level of achievement since the assessment is conducted just at the point where the added resistance due to wind and waves is at maximum.

Level 2 : Minimum power assessment

Adverse conditions			
1	Significant wave height	(m)	h _s 5.30
2	Peak wave period	(s)	T _p 7.5
3	Wave direction	(deg)	α 0.0
4	Mean wind speed	(m/s)	V _w 20.44
5	Required ship advance speed through the water in wind and wave direction from head to 30 degree off-head	(m/s)	V _A 1.03
6	Relative wind speed	(m/s)	V _{rel} 2.00
Resistance in adverse conditions			
7	Cable-water resistance	(kN)	R _{cw} 13.66
8	Added rudder resistance	(kN)	R _r 16.74
9	Added resistance due to wind	(kN)	R _w 133.50
10	Added resistance due to waves	(kN)	R _{wv} 377.18

In adverse conditions			
(kN)	T	(kN)	481.61
(kN)	R _{cw}	(kN)	13.66
(kN)	R _r	(kN)	16.74
(kN)	R _w	(kN)	133.50
(kN)	R _{wv}	(kN)	377.18
(kN)	R _c	(kN)	0.094
(kN)	P _{prop}	(kN)	3291
(kN)	Q _{prop}	(kN)	573.94
(kN)	P _{res}	(kN)	3773
(kN)	Q _{res}	(kN)	658.93
P _{req} = P _{prop} + P _{res}			
P _{req} = P _{prop} + P _{res}			

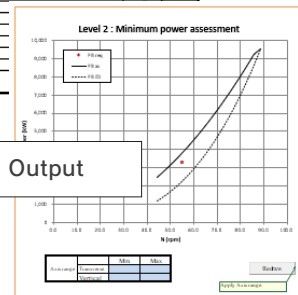

Structure of the system

The screenshot shows the software interface with various input fields for ship particulars, analysis options, and resistance data. A diagram of a ship hull is shown below the input fields, with arrows indicating the flow of data from the input fields to the hull diagram.

Level 2 : Minimum power assessment

Adverse conditions			
1	Significant wave height	(m)	H _s
2	Peak wave period	(s)	T _p
3	Wave direction	(deg)	α
4	Mean wind speed	(m/s)	V _m
5	Required air resistance speed through the water in wind and wave direction from head to 30 degree off-head	(m/s)	V ₁₀
6	Relative wind speed	(m/s)	V _{rel, 10}
Resistance in adverse conditions			
7	Calculated resistance	(kN)	R _c
8	Added hull resistance	(kN)	R _h
9	Added resistance due to wind	(kN)	R _w
10	Added resistance due to waves	(kN)	R _{wv}
Calculation of required brake power and torque in adverse conditions			
11	Required propeller thrust	(kN)	T
12	Load factor		K _{prop}
13	Advanced coefficient		K _{prop}
14	Propeller revolution	(rpm)	N
15	Frangee coefficient		K _{fr}
16	Required brake power		P _{br}
17	Required torque		Q _{br}
Load diagram corresponding to propeller revolution			
18	Available brake power		P _{av}
19	Torque on load diagram (Maximum torque)		Q _{max}
Adjustment			
20	Adjustment		α
21			

Output

The screenshot shows the software interface with a large 'Print' button and a 'Print for submission' label. The interface also displays the software name and version (Ver. 2.0).

Input

- ◇ Ship's principal particulars
- ◇ Self-propulsion factors
- ◇ Frontal and side windage area of hull and superstructure
- ◇ Propeller open water characteristics
- ◇ Torque-speed limitation curve of the engine provided by the engine manufacturer
- ◇ Added resistance in short-crested irregular waves, etc.

Analysis options

There are selectable options below.

- ◇ The self-propulsion factors
 - ① Tank test results
 - ② Empirical formula
- ◇ For the added resistance due to wind
 - ① Results from wind tunnel test
 - ② Fujiwara's formula
(ITTC 7.5-04-01-01.1:F.4)
 - ③ ITTC data sets
(ITTC 7.5-04-01-01.1:F.3)
- ◇ For the added resistance due to waves
 - ① Tank test results
 - ② Simplified formula

Output

- ◇ Results of the assessment for submission

GREEN/ SRM

Ship Recycling Management

Key Features

- ◆ Inventory development software compliant with the Ship Recycling Convention* requirements
- ◆ Exchange Material Declaration (MD) data electronically

PrimeShip-GREEN/SRM is an essential software tool for the development of the Inventory of Hazardous Materials (IHM) required for all ships greater than 500GT by the Ship Recycling Convention adopted in May 2009.

PrimeShip-GREEN/SRM allows suppliers and shipbuilders to exchange information electronically to reduce paperwork related to IHM development.

In order to substitute the client/server based IHM development software: PrimeShip-INVENTORY, NK has developed the web-based software "PrimeShip-GREEN/SRM". Utilizing cloud computing, PrimeShip-GREEN/SRM will certainly improve the productivity of users.

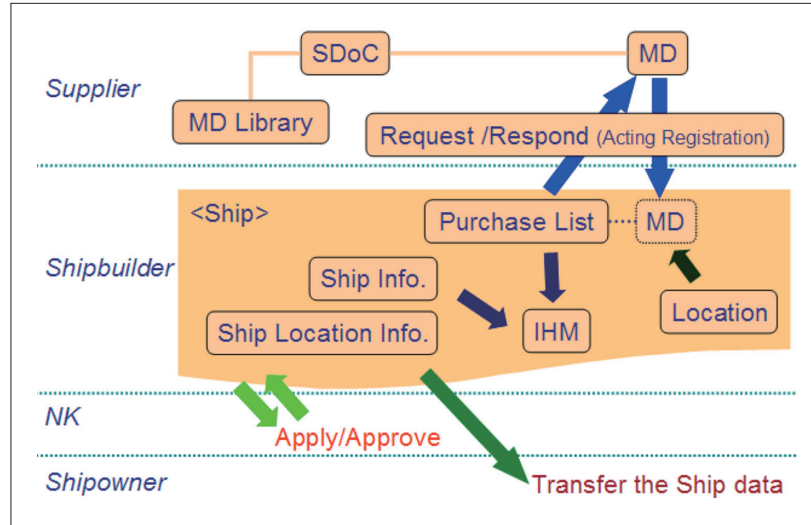

[For Suppliers]

PrimeShip-GREEN/SRM enables suppliers to consolidate the responses for shipbuilders' requests to submit Material Declaration and Supplier's Declaration of Conformity. In addition, suppliers can post their MD on MD Library so that the shipbuilders can find the MD by themselves.

[For Shipbuilders]

PrimeShip-GREEN/SRM allows shipbuilders to develop the IHM (Excel format) by requesting MD/SDoC to suppliers in the system and setting locations for MDs containing Hazardous Materials. PrimeShip-GREEN/SRM eliminates the need to post MD data and automatically calculates the amounts of Hazardous Materials at each location.

Concept of PrimeShip-GREEN/SRM

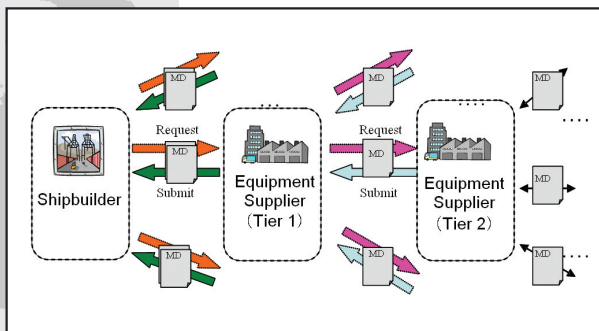

Screenshots

This screenshot shows the 'Purchase Item Mgmt' interface with various input fields for Shipbuilder, Ship Name, Purchase Item Category, Product number, Supplier code, and Inspection Method. It includes a table with columns for 'Purchase Item Code', 'Purchase Item', 'Product number', 'Supplier', 'Status', 'Completed On', 'Include IHM Above Threshold', 'Inspection Request No.', and 'Contact Person'.

This screenshot shows the 'Inventory Mgmt' interface with search filters and a table of results. The table has columns for 'No', 'Det all', 'Inventory', 'Reference inventory', 'Collected list', 'Uncollected list', 'Version', 'Approval Status', 'Transferred/Sold', 'Shipbuilder', 'Ship Name', 'IMO No.', 'Apply-To Class', and 'Up'.

No	Det all	Inventory	Reference inventory	Collected list	Uncollected list	Version	Approval Status	Transferred/Sold	Shipbuilder	Ship Name	IMO No.	Apply-To Class	Up
1						1.0	Pre-application	IT	ClassNK Shipbuilding 1 NK001	ClassNK SRM	9999999		

Ship Recycling Convention

Ship Recycling Convention* was adopted by the IMO in May 2009. Once the convention enters into force, all ships 500GT and greater, excluding those scrapped or recycled in their flag states, will be required to carry an Inventory of Hazardous Materials on board the ship.

IHM Development for New Ships

- Shipbuilders develop an Inventory by the following steps:
- <Step 1> Record submitted Material Declaration (MD) and Supplier's Declaration of Conformity (SDoC) for all procured products.
 - <Step 2> Screen all products containing Hazardous Materials above the threshold levels.
 - <Step 3> Identify the location of these products and calculate the amounts of Hazardous Materials at each location.
 - <Step 4> Prepare properly formatted Inventory.

Access to PrimeShip-GREEN/SRM

The requirement for using PrimeShip-GREEN/SRM is a web browser. Please access the following top page for user registration.

<https://www.psgreensrm.com>
