Amendment on 27 June 2024
Resolved by Technical Committee on 30 January 2024

Survey and Construction of Steel Ships Part C

Object of Amendment

Rules for the Survey and Construction of Steel Ships Part C
Guidance for the Survey and Construction of Steel Ships Part C

Reason for Amendment

The Society received various feedback, including requests for clarification and suggestions for improvement from relevant industry members. After reviewing this feedback, the Society decided to incorporate some of the suggestions it received and amend relevant requirements accordingly.

Outline of Amendment

(1) Specifies guidelines for external pressure considerations in hydrostatic tests when predetermined values are unavailable.
(2) Clarifies the cases of flooding to be considered.
(3) Specifies that for tankers in the harbour condition, strength evaluations may be based on the planned draught as documented in the Loading Manual for the loading condition.
(4) Specifies buckling strength assessment criteria for the cargo hold analysis of ships carrying liquefied gases in bulk (membrane tanks) in the 30-degree static heel condition and the collision condition.
(5) Clarifies the application of steel material categories for hatch coamings.
(6) Revises the allowable stress values used in bending strength evaluations of double hull structures.
(7) Clarifies an acceptable alternative evaluation method to the prescriptive formula used to calculate the moment of inertia of girders
(8) Revises the application scope of minimum thickness requirements.
(9) Revises the corrosion addition values for the cargo holds of PCC.
(10) Clarifies some definitions and corrects typographical errors.

Effective Date and Application

1. Effective date of this amendment is 27 June 2024.
2. Notwithstanding 1 above, the version of Part C of the Rules in effect prior to its comprehensive revision (hereinafter referred to as “old Part C”) may still be applied to the sister ships of those ships constructed under old Part C in cases where the date of the contract for construction of the sister ships is before 1 January 2025.

ID: DH23-08

An asterisk (*) after the title of a requirement indicates that there is also relevant information in the corresponding Guidance.

Amended	Original	Remarks
3.3 Net Scantling Approach **3.3.3 Corrosion Model for Strength Assessment** **3.3.3.1** The scantlings to be considered in this **Part C** are as follows: (1) Net offered thickness of plating is to be equal to or greater than the net required thickness of plating. (2) The required net section modulus, moment of inertia and shear area properties of local supporting members are to be calculated using the net thickness of the attached plate, web and flange. The net sectional dimensions of local supporting members are as specified in **Fig. 3.3.3-1**. The net cross-sectional area, the moment of inertia about the axis parallel to the attached plate and the associated neutral axis position are to be obtained by deducting 50 % of the applicable corrosion magnitude from the surface of the profile cross section. The required section modulus and required web thickness are to apply to areas clear of the end brackets. Local supporting members other than shown in **Fig. 3.3.3-1** are to be at the Society's discretion. ((3) to (5) are omitted.)	**3.3 Net Scantling Approach** **3.3.3 Corrosion Model for Strength Assessment** **3.3.3.1** The scantlings to be considered in this **Part C** are as follows: (1) Net offered thickness of plating is to be equal to or greater than the net required thickness of plating. (2) The required net section modulus, moment of inertia and shear area properties of local supporting members are to be calculated using the net thickness of the attached plate, web and flange. The net sectional dimensions of local supporting members are as specified in **Fig. 3.3.3-1**. The net cross-sectional area, the moment of inertia about the axis parallel to the attached plate and the associated neutral axis position are to be determined through applying a corrosion magnitude of 0.5 t_c deducted from the surface of the profile cross section. The required section modulus and required web thickness are to apply to areas clear of the end brackets. Local supporting members other than shown in **Fig. 3.3.3-1** are to be at the Society's discretion. ((3) to (5) are omitted.)	Clarifies the requirement on corrosion deduction of stiffeners.

Chapter 10 ADDITIONAL STRUCTURAL REQUIREMENTS

10.1 Car Deck

10.1.1 Plates and Beams

10.1.1.2 Section Modulus of Beams

1 The section modulus of beams of decks loaded with wheeled vehicles (hereinafter referred to as “car decks”) is not to be less than that obtained from the following formula. However, Where the span length or moment of inertia changes along the continuous beam, the scantlings of the beam are to be determined by direct strength calculation as specified in **-2**.

(Omitted)

P_{Ii}, P_{IIj}, P_{IIIk}: The wheel load at each support point, ~~P_{CDK} (kN)~~ as specifiedin **4.7.2.1** and **4.7.3.1**. Subscript “ Ii” means the ith load point from left end of the Ith beam (*See* **Fig. 10.1.1-2**). Subscript “ IIj (or IIr)” means the jth (or rth) load point from left end of the IIth beam (*See* **Fig. 10.1.1-2**). Subscript “$IIIk$” means the kth load point from left end of the IIIth beam (*See* **Fig. 10.1.1-2**).

α_{Ii}, α_{IIj}, α_{IIIk}: Distance (m) from each support point to the point of action of wheel load (*See* **Fig. 10.1.1-2**), when wheels are so arranged that M may be at its maximum value.

N_I, N_{II}, N_{III}: Number of wheel loads between each span

R_{II}: The value obtained from following the formula

$$R_{II} = \frac{1}{\ell}\sum_{j=1}^{N_{II}} P_{IIj}\left(\ell - \alpha_{IIj}\right)$$

10.1.1.3 Thickness of Car Deck

The thickness of car deck is to be in accordance with **(1)** or **(2)** below.

(1) Where the distance between the centres of wheel prints in a panel is not less than $2S + a$:

Clarifies the reference.

Amended-Original Requirements Comparison Table

Specifies that for tankers in the harbour condition, strength evaluations may be based on the planned draught as documented in the Loading Manual for the loading condition.

Amended	Original	Remarks

Double side	*P*3(1)	T_{SC}	M_{PT_max}	None	
	*P*4(2)	T_{BAL}	M_{PT_min}	Liquid cargo	

Notes:

(1) For ships designed so that their draught is smaller than T_{SC} when the cargo tank to be assessed is empty, the smaller draught may be considered. In such cases, it is to be clearly stated in the Loading Manual that exceeding the smaller draught is not allowed when the cargo tank is empty.

(2) For ships designed so that their draught is greater than T_{BAL} when the cargo tank to be assessed is loaded, the greater draught may be considered. In such cases, it is to be clearly stated in the Loading Manual that being less than the greater draught is not allowed when the cargo tank is loaded.

Amended	Original	Remarks
Chapter 6 LOCAL STRENGTH **6.1 Independent Prismatic Tanks** **6.1.2 Supporting Structures in Independent Prismatic Tanks** **6.1.2.3 Strength Criteria** Compressive stresses σ_a (N/mm^2) acting on each plate which composes the supporting structures, excluding top plate, is to comply with the following criteria: $\sigma_a < \sigma_{cr}$ σ_a: The compressive stress acting on each plate which composes the supporting structures, excluding top plate, as given by the following: $\sigma_a = \frac{F_a}{A_{min}}$ (N/mm^2) Where: F_a: Load acting on the supporting structures as given by the following:	**Chapter 6 LOCAL STRENGTH** **6.1 Independent Prismatic Tanks** **6.1.2 Supporting Structures in Independent Prismatic Tanks** **6.1.2.3 Strength Criteria** Compressive stresses σ_a (N/mm^2) acting on each plate which composes the supporting structures, excluding top plate, is to comply with the following criteria: $\sigma_a < \sigma_{cr}$ σ_a: The compressive stress acting on each plate which composes the supporting structures, excluding top plate, as given by the following: $\sigma_a = \frac{F_a}{A_{min}}$ (N/mm^2) Where: F_a: Load acting on the supporting structures as given by the following:	Corrects typographical errors.

Amended-Original Requirements Comparison Table

Amended	Original	Remarks
EFFECTIVE DATE AND APPLICATION **1.** Effective date of this amendment is 27 June 2024. **2.** Notwithstanding **1.** above, the version of Part C of the Rules in effect prior to its comprehensive revision (hereinafter referred to as "old Part C") may still be applied to the sister ships of those ships constructed under old Part C in cases where the date of the contract for construction of the sister ships is before 1 January 2025.		

Amended-Original Requirements Comparison Table
(Survey and Construction of Steel Ships Part C)

Amended	Original	Remarks
GUIDANCE FOR THE SURVEY AND CONSTRUCTION OF STEEL SHIPS	**GUIDANCE FOR THE SURVEY AND CONSTRUCTION OF STEEL SHIPS**	Specifies guidelines for external pressure considerations in hydrostatic tests when predetermined values are unavailable.
Part C HULL CONSTRUCTION AND EQUIPMENT	**Part C HULL CONSTRUCTION AND EQUIPMENT**	
Part 1 GENERAL HULL REQUIREMENTS	**Part 1 GENERAL HULL REQUIREMENTS**	
C4 LOADS	(Newly added)	
C4.4 Loads to be Considered in Local Strength **C4.4.3 Testing Condition** **C4.4.3.1 External Pressure** In the application of **4.4.3.1, Part C of the Rules**, it may be assumed that the external pressure is 0 or a draught less than that of Case 1 (i.e. a value set with some margin to the minimum draught in the test plans of existing ships) in cases where the information for Case 1 cannot be obtained beforehand.		

Amended	Original	Remarks
C7 STRENGTH OF PRIMARY SUPPORTING STRUCTURES **C7.2 Simple Girders** **C7.2.6 Bending Stiffness** **C7.2.6.2 Moment of Inertia of Girders** For the stiffeners supported by girders, **7.2.6.2, Part C of the Rules** need not be applied in cases where the hot spot stress, including stress due to relative displacement, specified in **9.3.5, Part C of the Rules** (*See* **9.3.2, Part C of the Rules**) is considered and the fatigue strength assessment required by **9.5, Part C of the Rules** is satisfactory.	(Newly added)	Clarifies an acceptable alternative evaluation method to the prescriptive formula used to calculate the moment of inertia of girders
C9 FATIGUE **C9.1 General** **C9.1.2 Application of Fatigue Strength Assessment** **C9.1.2.2 Application** "Ships for which fatigue strength assessment is deemed necessary by the Society" specified in **9.1.2.2-1(3), Part C of the Rules** include those that opt to perform strength assessment by the cargo hold analysis specified in **Chapter 8, Part C of the Rules** in accordance with **1.2.2.4, Part C of the Rules**. In such cases, however, only the assessments specified in **9.3.1.2(2), Part C of the Rules** need be performed.	(Newly added)	Clarifies an acceptable alternative evaluation method to the prescriptive formula used to calculate the moment of inertia of girders
