Editorial Correction for Technical Rules and Guidance

Issued on 26 December 2024

Nippon Kaiji Kyokai (ClassNK)

About this document:

This document is a compilation of corrections of editorial corrections of the Society's Technical Rules.

Errata in this document refer to corrections that do not change the requirements, intent, or technical background of the requirements specified in the rules and guidance, e.g., correction of typographical errors or references.

Content:

Regulations for the Classification and Registry of Ships Chapter 2 2.1.1

Correction	Present	Note
Ships will be assigned a class and registered in the Classification Register defined in **2.1.5** when the ships have been surveyed for classification by the Society’s Surveyors (hereinafter referred to as “the Surveyors”) with regard to their hull and equipment, machinery, fire protection and detection, means of escape, fire extinction, electrical installations, stability and load lines in accordance with the rules for the survey and construction of ships provided separately (hereinafter referred to as “the Ship Rules”) and found by the Society to be in compliance with the requirements of the Ship Rules. However, the Society may refuse the classification of ships regardless of the results of the survey in accordance with **1.4-3~~, Chapter 1~~ of the ~~“~~Conditions of Service for Classification of ~~ships~~Ships and ~~registration~~Registration of ~~installations”~~Installations**.	Ships will be assigned a class and registered in the Classification Register defined in **2.1.5** when the ships have been surveyed for classification by the Society’s Surveyors (hereinafter referred to as “the Surveyors”) with regard to their hull and equipment, machinery, fire protection and detection, means of escape, fire extinction, electrical installations, stability and load lines in accordance with the rules for the survey and construction of ships provided separately (hereinafter referred to as “the Ship Rules”) and found by the Society to be in compliance with the requirements of the Ship Rules. However, the Society may refuse the classification of ships regardless of the results of the survey in accordance with **1.4-3, Chapter 1 of the “Conditions of Service for Classification of ships and registration of installations”**.	Wording correction

Regulations for the Classification and Registry of Ships Chapter 2 2.6-1

Correction	Present	Note
1 The Society will withdraw the class and notify the same to the owner of a ship when: (1) it is requested by the owner of the ship; (2) the Society recognizes that the ship can no longer be used because it was scrapped, sank, etc.; (3) the Surveyors report that the ship has not complied with the Ship Rules as regards surveys defined in **2.2** and the Society accepts the report; (4) the ship is not subjected to the survey defined in **2.2**; (5) survey fees are not paid; or (6) the ships subject to **1.4-3**~~**, Chapter 1**~~ **of the** ~~**“**~~**Conditions of Service for Classification of** ~~**ships**~~**Ships and** ~~**registration**~~**Registration of** ~~**installations”**~~**Installations**.	**1** The Society will withdraw the class and notify the same to the owner of a ship when: (1) it is requested by the owner of the ship; (2) the Society recognizes that the ship can no longer be used because it was scrapped, sank, etc.; (3) the Surveyors report that the ship has not complied with the Ship Rules as regards surveys defined in **2.2** and the Society accepts the report; (4) the ship is not subjected to the survey defined in **2.2**; (5) survey fees are not paid; or (6) the ships subject to **1.4-3, Chapter 1 of the “Conditions of Service for Classification of ships and registration of installations”**. Measurements are to be carried out under the following conditions specified in the following ~~-~~(**1**) to ~~-~~(**8**~~.~~). The actual conditions during measurement are to be recorded on the noise survey report. (1) Measurements are to be taken with the ship in the loaded or ballast condition. (2) Measurements are to be taken at a course that is as straight as possible. (3) Measurements are to be taken at normal service speed and no less than 80% of the maximum continuous rating (*MCR*). Controllable pitch and Voith-Schneider propellers, if any, are to be in the normal seagoing position. This does not apply to special ship types and ships with special propulsion and power configurations. (4) All machinery, navigation instruments, radio and radar sets, etc., normally in use at normal seagoing condition and levels, including squelch are to operate throughout the measurement period. However, neither energized fog signals nor helicopter operations are to take place during the taking of these measurements. (5) Measurements in spaces containing emergency diesel engine driven generators, fire pumps or other emergency equipment that would normally be run only in emergency, or for test purposes, are to be taken with the equipment operating. Measurements are not intended for determining compliance with maximum noise level limits in **Table An4.1**, but as a reference for personal protection of seafarers carrying out maintenance, repair and test activities in such spaces.	Measurements are to be carried out under the following conditions specified in the following **-1** to **-8**. The actual conditions during measurement are to be recorded on the noise survey report.	Wording correction

(6) Mechanical ventilation, heating and air-conditioning equipment are to be in normal operation, taking into account that the capacity is to be in accordance with the design conditions. With respect to the requirement, air conditioning vents are to be kept open during the taking of noise measurements on board, unless they are designed to be kept closed in the normal operating condition. (7) In general, doors and windows are to be closed. With respect to the requirement, closing devices of ventilation grilles/louvres of cabin doors are to be kept open during the taking of noise measurements on board, unless they are designed to be kept closed in the normal operating condition. (8) Spaces are to be furnished with all necessary equipment. Measurements without soft furnishings may be taken but no allowance is to be made for their absence. Rechecks or follow-up readings may be taken with soft furnishings included.

of **(a)** to **(c)** is to be provided for inspection of the upper parts of vertical structure on transverse and longitudinal bulkheads. For example, there is need to provide continuous longitudinal permanent means of access in accordance with the requirements of **(b)** when the deck longitudinals and deck transverses are fitted on the deck but supporting brackets are fitted under the deck. (a) A continuous athwartship permanent means of access is to be arranged at each transverse bulkhead on the stiffened surface, at a minimum of 1.6 *m* to a maximum of 3 *m* below the deck head. (b) At least one continuous longitudinal permanent means of access is to be provided at each side of the tank. One of these accesses is to be at a minimum of 1.6 *m* to a maximum of 6 *m* below the deck head and the other is to be at a minimum of 1.6 *m* to a maximum of 3 *m* below the deck head. (c) Access between the arrangements specified in **(a)** and **(b)** and from the main deck to either **(a)** or **(b)** is to be provided. (d) A continuous longitudinal permanent means of access integrated into the structural members on the stiffened surface of a longitudinal bulkhead, in alignment, where possible, with horizontal girders of transverse bulkheads is to be provided for access to transverse webs from the upper deck and tank bottom unless permanent fittings are installed at the uppermost platform for use as an alternative means listed in **-~~9~~10**, for inspection at intermediate heights. In addition, the following **i)** and **ii)** are to be taken into account.	of **(a)** to **(c)** is to be provided for inspection of the upper parts of vertical structure on transverse and longitudinal bulkheads. For example, there is need to provide continuous longitudinal permanent means of access in accordance with the requirements of **(b)** when the deck longitudinals and deck transverses are fitted on the deck but supporting brackets are fitted under the deck. (a) A continuous athwartship permanent means of access is to be arranged at each transverse bulkhead on the stiffened surface, at a minimum of 1.6 *m* to a maximum of 3 *m* below the deck head. (b) At least one continuous longitudinal permanent means of access is to be provided at each side of the tank. One of these accesses is to be at a minimum of 1.6 *m* to a maximum of 6 *m* below the deck head and the other is to be at a minimum of 1.6 *m* to a maximum of 3 *m* below the deck head. (c) Access between the arrangements specified in **(a)** and **(b)** and from the main deck to either **(a)** or **(b)** is to be provided. (d) A continuous longitudinal permanent means of access integrated into the structural members on the stiffened surface of a longitudinal bulkhead, in alignment, where possible, with horizontal girders of transverse bulkheads is to be provided for access to transverse webs from the upper deck and tank bottom unless permanent fittings are installed at the uppermost platform for use as an alternative means listed in **-9**, for inspection at intermediate heights. In addition, the following **i)** and **ii)** are to be taken into account.	

i) For water ballast tanks of 5 *m* or more in width, such as on an ore carrier, side shell plating is to be considered in the same way as "longitudinal bulkhead". ii) For the application of this **-1(1)(d)**, wire lift platforms or other means which can provide an equal level of safety as permanent means of access specified in **-~~9~~10(2)**, are assumed as alternative means of access. However, rafting and permanent fittings for rafting are not permitted as alternatives to the continuous longitudinal permanent means of access. (e) A transverse permanent means of access on the cross-ties providing access to the tie flaring brackets at both sides of the tank, with access from one of the longitudinal permanent means of access in **(d)** for ships having cross-ties which are not less than 6 *m* above the tank bottom. (f) An alternative means listed in **-~~9~~10** may be provided for small ships with cargo oil tanks less than 17 *m* in height as an alternative to **(d)**. (2) For tanks less than 6 *m* in height, an alternative means listed in **-~~9~~10** or portable means may be utilized in lieu of permanent means of access. (3) Notwithstanding **(1)** and **(2)** above, tanks not containing internal structures need not to be provided with permanent means of access. (4) Means of access deemed appropriate by the Society are to be provided for access to under deck structures, transverse webs and cross-ties outside the reach of permanent and/or portable means of access, as required in **(1)** and **(2)** above. The means of access generally presumes the use of boats which are to be	i) For water ballast tanks of 5 *m* or more in width, such as on an ore carrier, side shell plating is to be considered in the same way as "longitudinal bulkhead". ii) For the application of this **-1(1)(d)**, wire lift platforms or other means which can provide an equal level of safety as permanent means of access specified in **-9(2)**, are assumed as alternative means of access. However, rafting and permanent fittings for rafting are not permitted as alternatives to the continuous longitudinal permanent means of access. (e) A transverse permanent means of access on the cross-ties providing access to the tie flaring brackets at both sides of the tank, with access from one of the longitudinal permanent means of access in **(d)** for ships having cross-ties which are not less than 6 *m* above the tank bottom. (f) An alternative means listed in **-9** may be provided for small ships with cargo oil tanks less than 17 *m* in height as an alternative to **(d)**. (2) For tanks less than 6 *m* in height, an alternative means listed in **-9** or portable means may be utilized in lieu of permanent means of access. (3) Notwithstanding **(1)** and **(2)** above, tanks not containing internal structures need not to be provided with permanent means of access. (4) Means of access deemed appropriate by the Society are to be provided for access to under deck structures, transverse webs and cross-ties outside the reach of permanent and/or portable means of access, as required in **(1)** and **(2)** above. The means of access generally presumes the use of boats which are to be	

comply with **-10(4)**. **2** For oil tankers: water ballast wing tanks of less than 5 *m* width forming double side spaces and their bilge hopper sections are to be provided with means of access in accordance with the following **(1)** to **(4)**. The requirements also apply to wing tanks designed as void spaces. (1) For double side spaces above the upper knuckle point of the bilge hopper sections, permanent means of access are to be provided in accordance with **(a)** to **(e)**: (a) Where the vertical distance between the uppermost horizontal stringer and the deck head is not less than 6 *m*, one continuous longitudinal permanent means of access is to be provided for the full length of the tank with a means to allow passing through transverse webs installed at a minimum of 1.6 *m* to a maximum of 3 *m* below the deck head with a vertical access ladder at each end of the tank. Means of access specified are to be connected to an access ladder from the deck required in **14.16.3.3-1**. Where two access hatches are required, access ladders at each end of the tank are to lead to the means of access. (b) A continuous longitudinal permanent means of access integrated in the structure at a vertical distance not exceeding 6 *m* apart is to be provided. (c) Plated stringers are, as far as possible, to be in alignment with horizontal girders of transverse bulkheads. (d) Notwithstanding **(a)** and **(b)** above, the continuous permanent means of access may be a wide longitudinal, which provides access to critical details on the opposite side by means of	comply with **-10(4)**. **2** For oil tankers: water ballast wing tanks of less than 5 *m* width forming double side spaces and their bilge hopper sections are to be provided with means of access in accordance with the following **(1)** to **(4)**. The requirements also apply to wing tanks designed as void spaces. (1) For double side spaces above the upper knuckle point of the bilge hopper sections, permanent means of access are to be provided in accordance with **(a)** to **(e)**: (a) Where the vertical distance between the uppermost horizontal stringer and the deck head is not less than 6 *m*, one continuous longitudinal permanent means of access is to be provided for the full length of the tank with a means to allow passing through transverse webs installed at a minimum of 1.6 *m* to a maximum of 3 *m* below the deck head with a vertical access ladder at each end of the tank. Means of access specified are to be connected to an access ladder from the deck required in **14.16.3.3-1**. Where two access hatches are required, access ladders at each end of the tank are to lead to the means of access. (b) A continuous longitudinal permanent means of access integrated in the structure at a vertical distance not exceeding 6 *m* apart is to be provided. (c) Plated stringers are, as far as possible, to be in alignment with horizontal girders of transverse bulkheads. (d) Notwithstanding **(a)** and **(b)** above, the continuous permanent means of access may be a wide longitudinal, which provides access to critical details on the opposite side by means of	

platforms attached as necessary on the web frames. Where the vertical opening of the web frame is located in way of the open part between the wide longitudinal and the longitudinal on the opposite side, platforms are to be provided on both sides of the web frames to allow safe passage through the web frame.	platforms attached as necessary on the web frames. Where the vertical opening of the web frame is located in way of the open part between the wide longitudinal and the longitudinal on the opposite side, platforms are to be provided on both sides of the web frames to allow safe passage through the web frame.	
(e) Notwithstanding **(a)** and **(b)** above, excess of not more than 10% may be accepted as a reasonable deviation, where deemed necessary for the integration of the permanent means of access with respect to the vertical distance of 6 *m* specified in **(a)** and **(b)** above.	(e) Notwithstanding **(a)** and **(b)** above, excess of not more than 10% may be accepted as a reasonable deviation, where deemed necessary for the integration of the permanent means of access with respect to the vertical distance of 6 *m* specified in **(a)** and **(b)** above.	
(2) For bilge hopper sections of which the vertical distance from the tank bottom to the upper knuckle point is not less than 6 *m*, one longitudinal permanent means of access is to be provided for the full length of the tank in accordance with the following **(a)** and **(b)**. It is to be accessible by a vertical permanent means of access at each end of the tank. Notwithstanding the requirements of **14.16.3.2(11)**, the height of a bilge hopper tank located outside of the parallel part of the ship may be taken as the maximum of the clear vertical distance measured from the bottom plating to the hopper plating of the tank.	(2) For bilge hopper sections of which the vertical distance from the tank bottom to the upper knuckle point is not less than 6 *m*, one longitudinal permanent means of access is to be provided for the full length of the tank in accordance with the following **(a)** and **(b)**. It is to be accessible by a vertical permanent means of access at each end of the tank. Notwithstanding the requirements of **14.16.3.2(11)**, the height of a bilge hopper tank located outside of the parallel part of the ship may be taken as the maximum of the clear vertical distance measured from the bottom plating to the hopper plating of the tank.	
(a) The longitudinal continuous permanent means of access may be installed at a minimum of 1.6 *m* to a maximum of 3 *m* from the top of the bilge hopper section. A platform extending from the longitudinal continuous permanent means of access in way of the web frame may be used to access the identified critical structural areas.	(a) The longitudinal continuous permanent means of access may be installed at a minimum of 1.6 *m* to a maximum of 3 *m* from the top of the bilge hopper section. A platform extending from the longitudinal continuous permanent means of access in way of the web frame may be used to access the identified critical structural areas.	
(b) Alternatively, the continuous longitudinal permanent means of access may be installed at a	(b) Alternatively, the continuous longitudinal permanent means of access may be installed at a	

minimum of 1.2 *m* below the top of the clear opening of the web ring allowing the use of portable means of access to reach identified critical structural areas. (3) Notwithstanding **(2)** above, in regards to the foremost and aftermost bilge hopper ballast tanks with raised bottoms, a combination of transverse and vertical means of access for access to the upper knuckle point for each transverse web may be accepted in place of the longitudinal permanent means of access. (4) Where the vertical distance referred to in **(2)** is less than 6 *m*, alternative means listed in **-~~9~~10** or portable means of access may be utilized in lieu of permanent means of access. To facilitate the operation of the alternative means of access, in-line openings in horizontal stringers are to be provided. The openings are to be of an adequate diameter and are to have suitable protective railings. **3** For bulk carriers, means of access to the overhead structure of the cross deck are to be fitted in accordance with the following **(1)** to **(5)**. (1) Permanent means of access are to be fitted to provide access to the overhead structure at both sides of the cross deck and in the vicinity of the centreline. Each means of access is to be accessible from the cargo hold access or directly from the main deck and installed at a minimum of 1.6 *m* to a maximum of 3 *m* below the deck. (2) An athwartship permanent means of access fitted on the transverse bulkhead at a minimum of 1.6 *m* to a maximum of 3 *m* below the cross deck head is deemed as equivalent to **(1)**. (3) Access to the permanent means of access in **(1)** and **(2)** above may be via the upper stool.	minimum of 1.2 *m* below the top of the clear opening of the web ring allowing the use of portable means of access to reach identified critical structural areas. (3) Notwithstanding **(2)** above, in regards to the foremost and aftermost bilge hopper ballast tanks with raised bottoms, a combination of transverse and vertical means of access for access to the upper knuckle point for each transverse web may be accepted in place of the longitudinal permanent means of access. (4) Where the vertical distance referred to in **(2)** is less than 6 *m*, alternative means listed in **-9** or portable means of access may be utilized in lieu of permanent means of access. To facilitate the operation of the alternative means of access, in-line openings in horizontal stringers are to be provided. The openings are to be of an adequate diameter and are to have suitable protective railings. **3** For bulk carriers, means of access to the overhead structure of the cross deck are to be fitted in accordance with the following **(1)** to **(5)**. (1) Permanent means of access are to be fitted to provide access to the overhead structure at both sides of the cross deck and in the vicinity of the centreline. Each means of access is to be accessible from the cargo hold access or directly from the main deck and installed at a minimum of 1.6 *m* to a maximum of 3 *m* below the deck. (2) An athwartship permanent means of access fitted on the transverse bulkhead at a minimum of 1.6 *m* to a maximum of 3 *m* below the cross deck head is deemed as equivalent to **(1)**. (3) Access to the permanent means of access in **(1)** and **(2)** above may be via the upper stool.	

(4) Ships having transverse bulkheads with full upper stools with access from the main deck which allows monitoring of all framing and plates from inside do not require permanent means of access of the cross deck. (5) Alternatively, movable means of access may be utilized for access to the overhead structure of the cross deck if its vertical distance is not greater than 17 *m* above the tank top. The movable means of access need not necessarily be carried aboard the ship. **4** For cargo holds of bulk carriers, means of access are to be fitted in accordance with the following **(1)** to **(6)**. (1) Permanent means of vertical access are to be provided in all cargo holds and built into the structure to allow for an inspection of a minimum of 25% of the total number of hold frames port and starboard equally distributed throughout the hold including at each end in way of transverse bulkheads. But in no circumstances is this arrangement to be less than 3 permanent means of vertical access fitted to each side (fore and aft ends of hold and mid-span). Permanent means of vertical access fitted between two adjacent hold frames is counted as access for the inspection of both hold frames. A portable means of access may be used to gain access over the sloping plating of lower hopper ballast tanks. (2) In addition to **(1)**, portable or movable means of access are to be utilized for access to the remaining hold frames up to their upper brackets and transverse bulkheads. (3) Portable or movable means of access may be utilized for access to hold frames up to their upper bracket in place of the permanent means required in **(1)**. These means of access are to be on board the ship and readily	(4) Ships having transverse bulkheads with full upper stools with access from the main deck which allows monitoring of all framing and plates from inside do not require permanent means of access of the cross deck. (5) Alternatively, movable means of access may be utilized for access to the overhead structure of the cross deck if its vertical distance is not greater than 17 *m* above the tank top. The movable means of access need not necessarily be carried aboard the ship. **4** For cargo holds of bulk carriers, means of access are to be fitted in accordance with the following **(1)** to **(6)**. (1) Permanent means of vertical access are to be provided in all cargo holds and built into the structure to allow for an inspection of a minimum of 25% of the total number of hold frames port and starboard equally distributed throughout the hold including at each end in way of transverse bulkheads. But in no circumstances is this arrangement to be less than 3 permanent means of vertical access fitted to each side (fore and aft ends of hold and mid-span). Permanent means of vertical access fitted between two adjacent hold frames is counted as access for the inspection of both hold frames. A portable means of access may be used to gain access over the sloping plating of lower hopper ballast tanks. (2) In addition to **(1)**, portable or movable means of access are to be utilized for access to the remaining hold frames up to their upper brackets and transverse bulkheads. (3) Portable or movable means of access may be utilized for access to hold frames up to their upper bracket in place of the permanent means required in **(1)**. These means of access are to be on board the ship and readily	

available for use. “Readily available” means capable of being transported to location in cargo hold and safely erected by ship’s staff. (4) The width of vertical ladders for access to hold frames is to be at least 300 *mm*, measured between stringers. (5) A single vertical ladder over 6 *m* in length is acceptable for the inspection of the hold side frames in a single skin construction. (6) For double-side skin construction no vertical ladder for the inspection of the cargo hold surfaces is required. Inspection of this structure is to be provided from within the double hull space. **5** For topside tanks of bulk carriers, means of access are to be fitted in accordance with the following **(1)** to **(4)**. Notwithstanding the requirements of **14.16.3.2(11)**, the height of a topside tank is to be the vertical distance measured at the ship’s side. (1) For each topside tank of not less than 6 *m* in height, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.6 *m* to a maximum of 3 *m* below deck with a vertical access ladder in the vicinity of each access to that tank. (2) If no access holes are provided through the transverse webs within 600 *mm* of the tank base and the web frame rings have a web height greater than 1 *m* in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safe access over each transverse web frame ring. (3) Three permanent means of access, fitted at the end bay and middle bay of each tank, are to be provided spanning from tank base up to the intersection of the sloping plate with the hatch side girder. The existing longitudinal structure, if fitted on the sloping plate in	available for use. “Readily available” means capable of being transported to location in cargo hold and safely erected by ship’s staff. (4) The width of vertical ladders for access to hold frames is to be at least 300 *mm*, measured between stringers. (5) A single vertical ladder over 6 *m* in length is acceptable for the inspection of the hold side frames in a single skin construction. (6) For double-side skin construction no vertical ladder for the inspection of the cargo hold surfaces is required. Inspection of this structure is to be provided from within the double hull space. **5** For topside tanks of bulk carriers, means of access are to be fitted in accordance with the following **(1)** to **(4)**. Notwithstanding the requirements of **14.16.3.2(11)**, the height of a topside tank is to be the vertical distance measured at the ship’s side. (1) For each topside tank of not less than 6 *m* in height, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.6 *m* to a maximum of 3 *m* below deck with a vertical access ladder in the vicinity of each access to that tank. (2) If no access holes are provided through the transverse webs within 600 *mm* of the tank base and the web frame rings have a web height greater than 1 *m* in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safe access over each transverse web frame ring. (3) Three permanent means of access, fitted at the end bay and middle bay of each tank, are to be provided spanning from tank base up to the intersection of the sloping plate with the hatch side girder. The existing longitudinal structure, if fitted on the sloping plate in	

the space may be used as part of this means of access. (4) For topside tanks of which the height is less than 6 *m*, alternative means listed in **-~~9~~10** or portable means may be utilized in lieu of the permanent means of access. **6** For bilge hopper tanks of bulk carriers, means of access are to be fitted in accordance with the following **(1)** to **(3)**. Notwithstanding the requirements of **14.16.3.2(11)**, the height of a bilge hopper tank located outside of the parallel part of the vessel may be taken as the maximum of the clear vertical height measured from the bottom plating to the hopper plating of the tank. (1) For each bilge hopper tank of not less than 6 *m* in height, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.2 *m* below the top of the clear opening of the web ring in accordance with **(a)** to **(c)**, with a vertical access ladder in the vicinity of each access to the tank. (a) An access ladder between the longitudinal continuous permanent means of access and the bottom of the space are to be provided at each end of the tank. (b) Alternatively, the longitudinal continuous permanent means of access can be located through the upper web plating above the clear opening of the web ring, at a minimum of 1.6 *m* below the top of the bilge hopper section, when this arrangement facilitates more suitable inspection of identified structurally critical areas. An enlarged longitudinal frame can be used for the purpose of the walkway. The foremost and aftermost bilge hopper ballast tanks with raised bottom, a combination of transverse and vertical	the space may be used as part of this means of access. (4) For topside tanks of which the height is less than 6 *m*, alternative means listed in **-9** or portable means may be utilized in lieu of the permanent means of access. **6** For bilge hopper tanks of bulk carriers, means of access are to be fitted in accordance with the following **(1)** to **(3)**. Notwithstanding the requirements of **14.16.3.2(11)**, the height of a bilge hopper tank located outside of the parallel part of the vessel may be taken as the maximum of the clear vertical height measured from the bottom plating to the hopper plating of the tank. (1) For each bilge hopper tank of not less than 6 *m* in height, one longitudinal continuous permanent means of access is to be provided along the side shell webs and installed at a minimum of 1.2 *m* below the top of the clear opening of the web ring in accordance with **(a)** to **(c)**, with a vertical access ladder in the vicinity of each access to the tank. (a) An access ladder between the longitudinal continuous permanent means of access and the bottom of the space are to be provided at each end of the tank. (b) Alternatively, the longitudinal continuous permanent means of access can be located through the upper web plating above the clear opening of the web ring, at a minimum of 1.6 *m* below the top of the bilge hopper section, when this arrangement facilitates more suitable inspection of identified structurally critical areas. An enlarged longitudinal frame can be used for the purpose of the walkway. The foremost and aftermost bilge hopper ballast tanks with raised bottom, a combination of transverse and vertical	

means of access for access to the sloping plate of hopper tank connection with side shell plating for each transverse web can be accepted in place of the longitudinal permanent means of access. (c) For double-side skin bulk carriers, the longitudinal continuous permanent means of access may be installed within 6 *m* from the knuckle point of the bilge, if used in combination with alternative methods to gain access to the knuckle point. (2) If no access holes are provided through the transverse ring webs within 600 *mm* of the tank base and the web frame rings have a web height greater than 1 *m* in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safe access over each transverse web frame ring. The height of web frame rings is to be measured in way of side shell and tank base. (3) For bilge hopper tanks of less than 6 *m* in height, alternative means listed in **-~~9~~10** or portable means may be utilized in lieu of the permanent means of access. That such means of access can be deployed and made readily available in the areas where needed is to be demonstrated. **7** For double-side skin tanks of bulk carriers, permanent means of access are to be provided in accordance with the requirements in **-1** or **-2** above, as applicable. **8** For fore peak tanks with a depth of not less than 6 *m* at the centreline of the collision bulkhead, suitable means of access are to be provided for access to critical areas such as the underdeck structure, stringers, collision bulkhead and side shell structure in accordance with the following **(1)** and **(2)**. (1) Stringers of less than 6 *m* in vertical distance from the deck head or a stringer immediately above are	means of access for access to the sloping plate of hopper tank connection with side shell plating for each transverse web can be accepted in place of the longitudinal permanent means of access. (c) For double-side skin bulk carriers, the longitudinal continuous permanent means of access may be installed within 6 *m* from the knuckle point of the bilge, if used in combination with alternative methods to gain access to the knuckle point. (2) If no access holes are provided through the transverse ring webs within 600 *mm* of the tank base and the web frame rings have a web height greater than 1 *m* in way of side shell and sloping plating, then step rungs/grab rails are to be provided to allow safe access over each transverse web frame ring. The height of web frame rings is to be measured in way of side shell and tank base. (3) For bilge hopper tanks of less than 6 *m* in height, alternative means listed in **-9** or portable means may be utilized in lieu of the permanent means of access. That such means of access can be deployed and made readily available in the areas where needed is to be demonstrated. **7** For double-side skin tanks of bulk carriers, permanent means of access are to be provided in accordance with the requirements in **-1** or **-2** above, as applicable. **8** For fore peak tanks with a depth of not less than 6 *m* at the centreline of the collision bulkhead, suitable means of access are to be provided for access to critical areas such as the underdeck structure, stringers, collision bulkhead and side shell structure in accordance with the following **(1)** and **(2)**. (1) Stringers of less than 6 *m* in vertical distance from the deck head or a stringer immediately above are	

considered to provide suitable access in combination with portable means of access. (2) Where the vertical distance between the deck head and stringers, stringers or the lowest stringer and the tank bottom is not less than 6 *m*, alternative means of access listed in **-~~9~~10** is to be provided. **9** Unless stated otherwise in **14.16.3.4**, vertical ladders that are fitted on vertical structures for inspection are to comprise of one or more ladder linking platforms spaced not more than 6 *m* apart vertically and displaced to one side of the ladder. Adjacent sections of ladder are to be laterally offset from each other by at least the width of the ladder. For the purpose of complying with the above, adjacent sections of ladders are to be in accordance with **14.16.3.3-6**. **10** Where the Administration and the ship's owner deems that a permanent means of access may be susceptible to damage during normal cargo loading and unloading operations or is impracticable to fit a permanent means of access, alternative means of access deemed appropriate by the Administration and the ship's owner may be utilized in lieu of those specified in **-1** to **-8** above. In this case, the details of the alternative means of access are to be in accordance with the following **(1)** to **(4)**. (1) The means of securing the alternative equipment are to be by means of the hull structure or a part permanently attached to it. (2) Alternative means of access include, but are not limited to, such devices as: (a) Hydraulic arm fitted with a stable base (b) Wire lift platform (c) Staging (d) Rafting (e) Robot arm or remotely operated vehicle (*ROV*) (f) Portable ladders more than 5 *m* long are only to	considered to provide suitable access in combination with portable means of access. (2) Where the vertical distance between the deck head and stringers, stringers or the lowest stringer and the tank bottom is not less than 6 *m*, alternative means of access listed in **-9** is to be provided. **9** Unless stated otherwise in **14.16.3.4**, vertical ladders that are fitted on vertical structures for inspection are to comprise of one or more ladder linking platforms spaced not more than 6 *m* apart vertically and displaced to one side of the ladder. The stresses in each panel are to be obtained according to the following procedures: 1) when the mesh model differs from the elementary plate panel geometry, the stresses σ_x~~ ,□σ~~, σ_y and τ acting on an elementary plate panel are to be evaluated by extrapolation and/or interpolation of surrounding meshes using the elements stresses or using the displacement based method described in ~~**App**~~**Ch 7, Appendix 2**. 2) stresses obtained from with superimposed or direct method have to be reduced for buckling assessment because of the Poisson effect, which is taken into consideration in both analysis methods. The correction has to be carried out after summation of stresses due to local and global loads. When the stresses σ_x^* and σ_y^* are both compressive stresses, a stress reduction is to be made according to the following formulae: $\sigma_x = (\sigma_x^* - 0.3\sigma_y^*)/0.91$ $\sigma_y = (\sigma_y^* - 0.3\sigma_x^*)/0.91$ Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$ Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$ σ_x^*, σ_y^* : Stresses containing the Poisson effect 3) determine stress distributions along edges of the considered buckling panel by introducing proper linear approximation as shown in **Fig. 2**. 4) calculate edge factor ψ according to **Ch 6, Sec 3**.	The stresses in each panel are to be obtained according to the following procedures: 1) when the mesh model differs from the elementary plate panel geometry, the stresses σ_x ,□σ_y and τ acting on an elementary plate panel are to be evaluated by extrapolation and/or interpolation of surrounding meshes using the elements stresses or using the displacement based method described in **App 2**. 2) stresses obtained from with superimposed or direct method have to be reduced for buckling assessment because of the Poisson effect, which is taken into consideration in both analysis methods. The correction has to be carried out after summation of stresses due to local and global loads. When the stresses σ_x^* and σ_y^* are both compressive stresses, a stress reduction is to be made according to the following formulae: $\sigma_x = (\sigma_x^* - 0.3\sigma_y^*)/0.91$ $\sigma_y = (\sigma_y^* - 0.3\sigma_x^*)/0.91$ Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$ Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$ σ_x^*, σ_y^* : Stresses containing the Poisson effect 3) determine stress distributions along edges of the considered buckling panel by introducing proper linear approximation as shown in **Fig. 2**. 4) calculate edge factor ψ according to **Ch 6, Sec 3**. Table 1 Categories of Fillet Welds

Category	Kinds of fillet welds	As-built thickness of abutting plate, t, in $mm^{(1)}$	Leg length of fillet weld, in $mm^{(2),(3)}$	Length of fillet welds, in mm	Pitch, in mm
$F0$	Double continuous weld	t	$0.7t$	-	-
$F1$	Double continuous weld	$t \le 10$	$0.5t + 1.0$	-	-
		$10 \le t < 20$	$0.4t + 2.0$	-	-
		$20 \le t$	$0.3t + 4.0$	-	-
$F2$	Double continuous weld	$t \le 10$	$0.4t + 1.0$	-	-
		$10 \le t < 20$	$0.3t + 2.0$	-	-
		$20 \le t$	$0.2t + 4.0$	-	-
$F3$	Double continuous weld	$t \le 10$	$0.3t + 1.0$	-	-
		$10 \le t < 20$	$0.2t + 2.0$		
		$20 \le t$	$0.1t + 4.0$		
$F4$	Intermittent weld	$t \le 10$	$0.5t + 1.0$	75	300
		$10 \le t < 20$	$0.4t + 2.0$		
		$20 \le t$	$0.3t + 4.0$		

(1) t is as-built thickness of the abutting plate, in mm. In case of cross joint as specified in **Fig. 1**, t is the thinner thickness of the continuous member and the abutting plate, to be considered independently for each abutting plate.

(2) Leg length of fillet welds is made fine adjustments corresponding to the corrosion addition t_C specified in **~~Ch3~~Ch 3, Sec 3, Table 1** as follows:

$+ 1.0\ mm$	for $t_C > 5$
$+ 0.5\ mm$	for $5 \ge t_C > 4$
$+ 0.0\ mm$	for $4 \ge t_C > 3$
$- 0.5\ mm$	for $t_C \le 3$

(3) Leg length is rounded to the nearest half millimetre.

1 General (1) A cargo emergency shutdown system is to be fitted to stop cargo flow in the event of an emergency, either internally within the ship, or during cargo transfer to ship or shore. The design of the *ESD* system is to avoid the potential generation of surge pressures within cargo transfer pipe work (see **-2(1)(d)**). (2) Auxiliary systems for conditioning the cargo that use toxic or flammable liquids or vapours are to be treated as cargo systems for the purposes of *ESD*. Indirect refrigeration systems using an inert medium, such as nitrogen, need not be included in the *ESD* function. (3) The *ESD* system is to be activated by the manual and automatic initiations listed in **Table ~~18~~N18.1**. Any additional initiations are only to be included in the *ESD* system if it can be shown that their inclusion does not reduce the integrity and reliability of the system overall. (4) Ship's *ESD* systems are to incorporate a ship-shore link in accordance with recognized standards. (5) A functional flow chart of the *ESD* system and related systems is to be provided in the cargo control station and on the navigation bridge.	**1** General (1) A cargo emergency shutdown system is to be fitted to stop cargo flow in the event of an emergency, either internally within the ship, or during cargo transfer to ship or shore. Correction	Present	Note
4 For time domain calculation specified in **-2** and frequency domain calculation specified in **-3**, further the requirements given in the following **(1)** ~~to **(3**~~and **(2)** are also to be complied with. (1) The aim of time domain torsional vibration simulations is to estimate the extreme torsional load for the ship's lifespan. The simulation model can be taken from the normal lumped mass elastic torsional vibration model, including damping. For a time domain analysis, the model should include the ice excitation at the propeller, other relevant excitations and the mean torques provided by the prime mover and hydrodynamic mean torque in the propeller. The calculations should cover variation of phase between the ice excitation and prime mover excitation. This is extremely relevant to propulsion lines with directly driven combustion engines. Time domain calculations are to be calculated for the maximum continuous revolutions condition, maximum continuous revolutions bollard conditions and for resonant speed, so that the resonant vibration responses can be obtained. (2) For frequency domain calculations, the load should be estimated as a Fourier component analysis of the continuous sequence of half sine load sequences. First and second order blade components should be used for excitation.	**4** For time domain calculation specified in **-2** and frequency domain calculation specified in **-3**, further the requirements given in the following **(1)** to **(3)** are also to be complied with. (3) The following assumptions are to be used when combining the oil outflow parameters. (a) The mean oil outflow is to be calculated independently for side damage and bottom	

damage and then combined into the non-dimensional oil outflow parameter O_M, as follows: $O_M = (0.4 \cdot O_{MS} + 0.6 \cdot O_{MB})/C$ O_{MS} : Mean outflow for side damage (m^3) O_{MB} : Mean outflow for bottom damage (m^3) (b) For bottom damage, independent calculations for mean outflow are to be for 0*m* and minus 2.5*m* tide conditions, and then combined as follows: $O_{MB} = 0.7 \cdot O_{MB(0)} + 0.3 \cdot O_{MB(2.5)}$ $O_{MB(0)}$: Mean outflow for 0*m* tide condition (m^3) $O_{MB(2.5)}$: Mean outflow for minus 2.5*m* tide condition (m^3) (4) The mean outflow for side damage O_{MS} is to be calculated as follows: $O_{MS} = \sum_i^n P_{S(i)} \cdot O_{S(i)}$ (m^3) *i* : Represents each oil fuel tank under consideration *n* : Total number of oil fuel tanks $P_{S(i)}$: The probability of penetrating oil fuel tank *i* from side damage, calculated in accordance with **(6)** $O_{S(i)}$: The outflow, in m^3, from side damage to oil fuel tank *i*, which is assumed equal to the total volume in oil fuel tank *i* at 98% filling (5) The mean outflow for bottom damage is to be calculated for each tidal condition as follows: (a) $O_{MB(0)} = \sum_i^n P_{B(i)} \cdot O_{B(i)} \cdot C_{DB(i)}$ (m^3) *i* : Represents each oil fuel tank under consideration	damage and then combined into the non-dimensional oil outflow parameter O_M, as follows: $O_M = (0.4 \cdot O_{MS} + 0.6 \cdot O_{MB})/C$ O_{MS} : Mean outflow for side damage (m^3) O_{MB} : Mean outflow for bottom damage (m^3) (b) For bottom damage, independent calculations for mean outflow are to be for 0*m* and minus 2.5*m* tide conditions, and then combined as follows: $O_{MB} = 0.7 \cdot O_{MB(0)} + 0.3 \cdot O_{MB(2.5)}$ $O_{MB(0)}$: Mean outflow for 0*m* tide condition (m^3) $O_{MB(2.5)}$: Mean outflow for minus 2.5*m* tide condition (m^3) (4) The mean outflow for side damage O_{MS} is to be calculated as follows: $O_{MS} = \sum_i^n P_{S(i)} \cdot O_{S(i)}$ (m^3) *i* : Represents each oil fuel tank under consideration *n* : Total number of oil fuel tanks $P_{S(i)}$: The probability of penetrating oil fuel tank *i* from side damage, calculated in accordance with **(6)** $O_{S(i)}$: The outflow, in m^3, from side damage to oil fuel tank *i*, which is assumed equal to the total volume in oil fuel tank *i* at 98% filling (5) The mean outflow for bottom damage is to be calculated for each tidal condition as follows: (a) $O_{MB(0)} = \sum_i^n P_{B(i)} \cdot O_{B(i)} \cdot C_{DB(i)}$ (m^3) *i* : Represents each oil fuel tank under consideration	

n : Total number of oil fuel tanks $P_{B(i)}$: The probability of penetrating oil fuel tank i from bottom damage, calculated in accordance with **(7)** $O_{B(i)}$: The outflow, in m^3, from side damage to oil fuel tank i, calculated in accordance with **(c)** and **(d)** $C_{DB(i)}$: Factor to account for oil capture as defined in **(e)** (b) $O_{MB(2.5)} = \sum_{i}^{n} P_{B(i)} \cdot O_{B(i)} \cdot C_{DB(i)} \quad (m^3)$ i, n, $P_{B(i)}$ and $C_{DB(i)}$: As defined in **(a)** $O_{B(i)}$: The outflow from oil fuel tank i, in m^3, after tidal change (c) The oil outflow $O_{B(i)}$ for each oil fuel tank is to be calculated based on pressure balance principles, in accordance with the following assumptions: i) The ship is to be assumed stranded with zero trim and heel, with the stranded draught prior to tidal change equal to the partial load line draught d_P. ii) The oil fuel level after damage is to be calculated as follows: $h_F = \{(d_P + t_C - Z_l)(\rho_S)\}/\rho_n$ h_F : The height of the oil fuel surface above Z_l (m) t_C : The tidal change, in m. Reductions in tide are to be expressed as negative values. Z_l : The height of the lowest point in the oil fuel tank above baseline (m) ρ_S : Density of seawater, to be taken as 1,025 kg/m^3 ρ_n : Nominal density of the oil fuel, as	n : Total number of oil fuel tanks $P_{B(i)}$: The probability of penetrating oil fuel tank i from bottom damage, calculated in accordance with **(7)** $O_{B(i)}$: The outflow, in m^3, from side damage to oil fuel tank i, calculated in accordance with **(c)** and **(d)** $C_{DB(i)}$: Factor to account for oil capture as defined in **(e)** (b) $O_{MB(2.5)} = \sum_{i}^{n} P_{B(i)} \cdot O_{B(i)} \cdot C_{DB(i)} \quad (m^3)$ i, n, $P_{B(i)}$ and $C_{DB(i)}$: As defined in **(a)** $O_{B(i)}$: The outflow from oil fuel tank i, in m^3, after tidal change (c) The oil outflow $O_{B(i)}$ for each oil fuel tank is to be calculated based on pressure balance principles, in accordance with the following assumptions: i) The ship is to be assumed stranded with zero trim and heel, with the stranded draught prior to tidal change equal to the partial load line draught d_P. ii) The oil fuel level after damage is to be calculated as follows: $h_F = \{(d_P + t_C - Z_l)(\rho_S)\}/\rho_n$ h_F : The height of the oil fuel surface above Z_l (m) t_C : The tidal change, in m. Reductions in tide are to be expressed as negative values. Z_l : The height of the lowest point in the oil fuel tank above baseline (m) ρ_S : Density of seawater, to be taken as 1,025 kg/m^3 ρ_n : Nominal density of the oil fuel, as	

defined in **(2)(c)** (d) The oil outflow $O_{B(i)}$ for any tanks bounding the bottom shell is to be taken not less than the following formula, but no more than the tank capacity: $O_{B(i)} = H_W \cdot A$ H_W is to be taken as follows: i) $H_W = 1.0$ (*m*), when $Y_B = 0$ ii) $H_W = B_B/50$ but not greater than 0.4*m*, when Y_B is greater than $B_B/5$ or 11.5*m*, whichever is less. For Y_B values outboard $B_B/5$ or 11.5*m*, whichever is less, H_W is to be linearly interpolated. (See ~~**Figure**~~**Fig. 3-3**) iii) "H_W" is to be measured upwards from the midship flat bottom line. In the turn of the bilge area and at locations without a clearly defined turn of the bilge, H_W is to be measured from a line parallel to the midship flat bottom, as shown for distance "*h*" in ~~**Figure**~~**Fig. 3-1**. Y_B : The minimum value of Y_B over the length of the oil fuel tank, where at any given location, Y_B is the transverse distance between the side shell at waterline d_B and the tank at or below waterline d_B. A : The maximum horizontal projected area of the oil fuel tank up to the level of H_W from the bottom of the tank. (e) In the case of bottom damage, a portion from the outflow from an oil fuel tank may be captured by non-oil compartments. This effect is approximated by application of the factor $C_{DB(i)}$ for each tank, which is to be taken as follows: $C_{DB(i)} = 0.6$ for oil fuel tanks bounded from	defined in **(2)(c)** (d) The oil outflow $O_{B(i)}$ for any tanks bounding the bottom shell is to be taken not less than the following formula, but no more than the tank capacity: $O_{B(i)} = H_W \cdot A$ H_W is to be taken as follows: i) $H_W = 1.0$ (*m*), when $Y_B = 0$ ii) $H_W = B_B/50$ but not greater than 0.4*m*, when Y_B is greater than $B_B/5$ or 11.5*m*, whichever is less. For Y_B values outboard $B_B/5$ or 11.5*m*, whichever is less, H_W is to be linearly interpolated. (See **Figure 3-3**) iii) "H_W" is to be measured upwards from the midship flat bottom line. In the turn of the bilge area and at locations without a clearly defined turn of the bilge, H_W is to be measured from a line parallel to the midship flat bottom, as shown for distance "*h*" in **Figure 3-1**. Y_B : The minimum value of Y_B over the length of the oil fuel tank, where at any given location, Y_B is the transverse distance between the side shell at waterline d_B and the tank at or below waterline d_B. A : The maximum horizontal projected area of the oil fuel tank up to the level of H_W from the bottom of the tank. (e) In the case of bottom damage, a portion from the outflow from an oil fuel tank may be captured by non-oil compartments. This effect is approximated by application of the factor $C_{DB(i)}$ for each tank, which is to be taken as follows: $C_{DB(i)} = 0.6$ for oil fuel tanks bounded from	Wording correction Wording correction

below by non-oil compartments; $C_{DB(i)} = 1.0$ for otherwise. (6) The probability P_S of breaching a compartment from side damage is to be calculated as follows: $P_S = P_{SL} \cdot P_{SV} \cdot P_{ST}$ $P_{SL} = 1 - P_{Sf} - P_{Sa}$: Probability the damage will extend into the longitudinal zone bounded by X_a and X_f $P_{SV} = 1 - P_{Su} - P_{Sl}$: Probability the damage will extend into the vertical zone bounded by Z_l and Z_u $P_{ST} = 1 - P_{Sy}$: Probability the damage will extend transversely beyond the boundary defined by y P_{Sa}, P_{Sf}, P_{Sl} and P_{Su} : Probabilities defined as the follows, are to be determined by linear interpolation from the table of probabilities for side damage provided in **Table 3-1**. P_{Sa} : The probability the damage will lie entirely aft of location X_a/L_f P_{Sf} : The probability the damage will lie entirely forward of location X_f/L_f P_{Sl} : The probability the damage will lie entirely below the tank P_{Su} : The probability the damage will lie entirely above the tank P_{Sy} : The probability the damage will lie entirely outboard of the tank. P_{Sy} is to be calculated as follows. However, P_{Sy} is not to be taken greater than 1.	below by non-oil compartments; $C_{DB(i)} = 1.0$ for otherwise. (6) The probability P_S of breaching a compartment from side damage is to be calculated as follows: $P_S = P_{SL} \cdot P_{SV} \cdot P_{ST}$ $P_{SL} = 1 - P_{Sf} - P_{Sa}$: Probability the damage will extend into the longitudinal zone bounded by X_a and X_f $P_{SV} = 1 - P_{Su} - P_{Sl}$: Probability the damage will extend into the vertical zone bounded by Z_l and Z_u $P_{ST} = 1 - P_{Sy}$: Probability the damage will extend transversely beyond the boundary defined by y P_{Sa}, P_{Sf}, P_{Sl} and P_{Su} : Probabilities defined as the follows, are to be determined by linear interpolation from the table of probabilities for side damage provided in **Table 3-1**. P_{Sa} : The probability the damage will lie entirely aft of location X_a/L_f P_{Sf} : The probability the damage will lie entirely forward of location X_f/L_f P_{Sl} : The probability the damage will lie entirely below the tank P_{Su} : The probability the damage will lie entirely above the tank P_{Sy} : The probability the damage will lie entirely outboard of the tank. P_{Sy} is to be calculated as follows. However, P_{Sy} is not to be taken greater than 1.	

$P_{Sy} = (24.96 - 199.6\,y/B_S)(y/B_S)$ for $y/B_S \le 0.05$ $P_{Sy} = 0.749 + \{5 - 44.4(y/B_S - 0.05)\}(y/B_S - 0.05)$ for $0.05 < y/B_S < 0.1$ $P_{Sy} = 0.888 + 0.56(y/B_S - 0.1)$ for $y/B_S \ge 0.1$ X_a : The longitudinal distance from the aft terminal of L_f to the aftmost point on the compartment being considered (m) X_f : The longitudinal distance from the aft terminal of L_f to the foremost point on the compartment being considered (m) Z_l : The vertical distance from the moulded baseline to the lowest point on the compartment being considered (m). Where Z_l is greater than D_S, Z_l is to be taken as D_S. Z_u : The vertical distance from the moulded baseline to the highest point on the compartment being considered (m). Where Z_u is greater than D_S, Z_u is to be taken as D_S. y : The minimum horizontal distance measured at right angles to the centreline between the compartment under consideration and the side shell (m). In way of the turn of the bilge, y need not to be considered below a distance h above baseline, where h is lesser of $B/10$, $3m$ or the top of the tank. (7) The probability P_B of breaching a compartment from bottom damage is to be calculated as follows: $P_B = P_{BL} \cdot P_{BT} \cdot P_{BV}$	$P_{Sy} = (24.96 - 199.6\,y/B_S)(y/B_S)$ for $y/B_S \le 0.05$ $P_{Sy} = 0.749 + \{5 - 44.4(y/B_S - 0.05)\}(y/B_S - 0.05)$ for $0.05 < y/B_S < 0.1$ $P_{Sy} = 0.888 + 0.56(y/B_S - 0.1)$ for $y/B_S \ge 0.1$ X_a : The longitudinal distance from the aft terminal of L_f to the aftmost point on the compartment being considered (m) X_f : The longitudinal distance from the aft terminal of L_f to the foremost point on the compartment being considered (m) Z_l : The vertical distance from the moulded baseline to the lowest point on the compartment being considered (m). Where Z_l is greater than D_S, Z_l is to be taken as D_S. Z_u : The vertical distance from the moulded baseline to the highest point on the compartment being considered (m). Where Z_u is greater than D_S, Z_u is to be taken as D_S. y : The minimum horizontal distance measured at right angles to the centreline between the compartment under consideration and the side shell (m). In way of the turn of the bilge, y need not to be considered below a distance h above baseline, where h is lesser of $B/10$, $3m$ or the top of the tank. (7) The probability P_B of breaching a compartment from bottom damage is to be calculated as follows: $P_B = P_{BL} \cdot P_{BT} \cdot P_{BV}$	

$P_{BL} = 1 - P_{Bf} - P_{Ba}$: Probability the damage will extend into the longitudinal zone bounded by X_a and X_f $P_{BT} = 1 - P_{Bp} - P_{Bs}$: Probability the damage will extend into the transverse zone bounded by Y_p and Y_s $P_{BV} = 1 - P_{Bz}$: Probability the damage will extend vertically beyond the boundary defined by z P_{Ba}, P_{Bf}, P_{Bp} and P_{Bs} : Probabilities defined as the follows, are to be determined by linear interpolation from the table of probabilities for side damage provided in **Table 3-2**. P_{Ba} : The probability the damage will lie entirely aft of location X_a / L_f P_{Bf} : The probability the damage will lie entirely forward of location X_f / L_f P_{Bp} : The probability the damage will lie entirely to port of the tank P_{Bs} : The probability the damage will lie entirely to starboard of the tank P_{Bz} : The probability the damage will lie entirely below the tank. P_{Bz} is to be calculated as follows. However, P_{Bz} is not to be taken greater than 1. $P_{Bz} = (14.5 - 67\,z/D_S)(z/D_S)$ for $z/D_S \le 0.1$ $P_{Bz} = 0.78 + 1.1(z/D_S - 0.1)$ for $z/D_S > 0.1$	$P_{BL} = 1 - P_{Bf} - P_{Ba}$: Probability the damage will extend into the longitudinal zone bounded by X_a and X_f $P_{BT} = 1 - P_{Bp} - P_{Bs}$: Probability the damage will extend into the transverse zone bounded by Y_p and Y_s $P_{BV} = 1 - P_{Bz}$: Probability the damage will extend vertically beyond the boundary defined by z P_{Ba}, P_{Bf}, P_{Bp} and P_{Bs} : Probabilities defined as the follows, are to be determined by linear interpolation from the table of probabilities for side damage provided in **Table 3-2**. P_{Ba} : The probability the damage will lie entirely aft of location X_a / L_f P_{Bf} : The probability the damage will lie entirely forward of location X_f / L_f P_{Bp} : The probability the damage will lie entirely to port of the tank P_{Bs} : The probability the damage will lie entirely to starboard of the tank P_{Bz} : The probability the damage will lie entirely below the tank. P_{Bz} is to be calculated as follows. However, P_{Bz} is not to be taken greater than 1. $P_{Bz} = (14.5 - 67\,z/D_S)(z/D_S)$ for $z/D_S \le 0.1$ $P_{Bz} = 0.78 + 1.1(z/D_S - 0.1)$ for $z/D_S > 0.1$	

D_S : The moulded depth, in m, measured at mid-length to the upper deck at side X_a and X_f : As defined in **(6)** Y_p : The transverse distance from the port-most point on the compartment located at or below the waterline d_B, to a vertical plane located $B_B/2$ to starboard of the ship's centerline (m). Y_s : The transverse distance from the starboard-most point on the compartment located at or below the waterline d_B, to a vertical plane located $B_B/2$ to starboard of the ship's centerline (m) z : The minimum value of z over the length of the compartment, where, at any given longitudinal location, z is the vertical distance from the lower point of the bottom shell at that longitudinal location to the lower point of the compartment at that longitudinal location (m). (8) For the purpose of maintenance and inspection, any oil fuel tanks that do not border the outer shell plating are to be located no closer to the bottom shell plating than the minimum value of h in **-5** and no closer to the side shell plating than the applicable minimum value of w in **-6** or **-7**.	D_S : The moulded depth, in m, measured at mid-length to the upper deck at side X_a and X_f : As defined in **(6)** Y_p : The transverse distance from the port-most point on the compartment located at or below the waterline d_B, to a vertical plane located $B_B/2$ to starboard of the ship's centerline (m). Y_s : The transverse distance from the starboard-most point on the compartment located at or below the waterline d_B, to a vertical plane located $B_B/2$ to starboard of the ship's centerline (m) z : The minimum value of z over the length of the compartment, where, at any given longitudinal location, z is the vertical distance from the lower point of the bottom shell at that longitudinal location to the lower point of the compartment at that longitudinal location (m). (8) For the purpose of maintenance and inspection, any oil fuel tanks that do not border the outer shell plating are to be located no closer to the bottom shell plating than the minimum value of h in **-5** and no closer to the side shell plating than the applicable minimum value of w in **-6** or **-7**.	

Rules for Marine Pollution Prevention Systems Part 3 Chapter 3 3.2.4(1)

Correction	Present	Note
(1) Every oil tanker of 5,000 *tonnes* deadweight and above is to comply with any one of the following requirements **(a)** to **(c)** : (a) The entire cargo tank length is to be protected by ballast tanks or spaces other than tanks that carry oil as follows: i) Wing tanks or spaces are to extend either for the full depth of the ship's side or from the top of the double bottom to the uppermost deck, disregarding a rounded gunwale where fitted. They are to be arranged such that the cargo tanks are located inboad of the moulded line of the side shell plating, nowhere less than the distance w which, as shown in **Fig. 3-4**, is measured at any cross-section at right angles to the side shell, as specified below: $w = 0.5 + \frac{DW}{20,000}$ or 2.0*m*, whichever is the lesser. However, the minimum value of *h* = 1.0*m* ii) At any cross-section the depth of each double bottom tank or space is to be such that the distance *h* between the bottom of the cargo tanks and the moulded line of the bottom shell plating measured at right angles to the bottom shell plating as shown in **Fig. 3-4** is not less than specified below: *h* = *B*/15 or 2.0*m*, whichever is the lesser. However, the minimum value of *h* = 1.0*m* iii) When the distances *h* and *w* are different at turn of the bilge area or at locations without	(1) Every oil tanker of 5,000 *tonnes* deadweight and above is to comply with any one of the following requirements **(a)** to **(c)** : (a) The entire cargo tank length is to be protected by ballast tanks or spaces other than tanks that carry oil as follows: i) Wing tanks or spaces are to extend either for the full depth of the ship's side or from the top of the double bottom to the uppermost deck, disregarding a rounded gunwale where fitted. <tr><td colspan="2">
Table 2.8.1-1 Approval Procedure of Preventive Maintenance System for Oil Lubricated Propeller Shafts (<i>PSCM</i>)
<table>
<tr><th>Item</th><th>Procedures</th></tr>
<tr><td>1 General</td><td>(1) These procedures will apply to ships intended for the preventative maintenance of propeller shafts. This system permits the shipowners to maintain the shafts using preventive measures such as by carrying out lubricating oil analysis regularly and diagnosing the lubricating condition of the shaft based on the results.</td></tr>
<tr><td>2 Application</td><td>(1) The executive management (hereinafter referred to as “management”) responsible for adopting the preventive maintenance system according to the procedures is to submit to the Society three copies of the maintenance manual specifying at least the following (a) to (f).
(a) Management’s policy for implementing the preventive maintenance system
(b) Procedures and personnel responsible for sampling oil, monitoring parameters such as oil analysis results and recording the necessary data
(c) Procedures and personnel responsible for selecting and controlling the analytical testing machines (or testing laboratory) and the measuring devices for monitoring parameters
(d) Procedures and personnel responsible for review of each parameter monitored and diagnosing the lubricating condition thereby
(e) Procedures and personnel responsible for handling any abnormalities found (including those for reporting to the Society)
(f) Procedures and personnel responsible for ensuring that proper maintenance is carried out according to the maintenance manual
(2) The Society returns two copies of the documents to the applicant after review and approval. Management is to keep one copy of the approved documents on board the ship and the other copy of the approved documents either on hand or at the shipowner’s office.
(3) The application is to be submitted within 6 <i>months</i> from the date of completion of the Classification Survey or the previous Ordinary Survey of the propeller shaft. However, this 6 <i>months</i> period may be waived in cases where supplementary documentation confirming the soundness of the propeller shafting system is submitted.</td></tr>
<tr><td>3 Approval and Notation</td><td>(1) The Society examines the documents submitted and bases its approval on items such as the management system, the maintenance procedures and the criteria for parameters (including the criteria for alarm and abnormal conditions) of oil analysis results. The Society assigns approved ships with the notation <i>PSCM</i> as classification characters.</td></tr>
</table>
</td><td>Wording correction</td></tr>
</table>

4 Approval Conditions

(1) Management system
  - (a) Management is to state clearly that it will take responsibility for proper implementation of the preventive maintenance of the related parts according to the manual and familiarize the crew concerned with the procedures.
  - (b) Management is to verify that parameters such as oil analysis results are all within their limits and to take suitable measures as necessary. Management is to report to the Society immediately where any abnormality is found.
  - (c) Management is to verify that suitable maintenance is carried out according to the manual.
  - (d) The items monitored or reviewed according to the manual are to be recorded.

(2) Maintenance procedures
  - (a) Oil sampling for analytical testing is to be carried out regularly at the intervals of at least 6 *months* and the procedures are in accordance with the following.
    - i) Sampling is to be carried out at sea as much as possible. The sampling oil quantity is about 200 *ml* and it is to be always from a fixed place after fully draining. For example, the air purge pipe at the pump exit or oil sample cock; places where the sampled oil can be representative of the system.
    - ii) Where the sampling can only be conducted at port, the sampling is to be carried out after sufficient circulation of the oil with an oil pump if one is available, and according to the method in **i)** above. Otherwise, the oil is to be sampled from a few points at different levels and all the samples are mixed together as the testing sample.
  - (b) Monitoring and recording of each parameter is to be properly carried out and the following data is to be recorded at each sampling.
    - i) Temperature of the circulation oil
    - ii) Temperature of the aft stern tube bearing
    - iii) Sampling date, service oil name, service hours, total oil quantity and oil consumption rate (*l/day*)
  - (c) The testing machines and measuring devices for monitoring the parameters are to have their accuracy

(3) Criteria for parameters

Management is to determine the criteria for each parameter for the ship based on the reference standards below and by taking into account its experience and knowledge.
  - (a) Analytical items and methods:
    - i) Analytical items and methods: Refer to **Table 1** as a standard. However, alternative analytical items and methods can be adopted instead when deemed appropriate by the Society.
    - ii) Standard criteria: To be within the max. values specified in **Table 1** counting from the values of the new oil
    - iii) Alarm values: To be less than double the standard criteria (where any parameter exceeds the alarm value, the testing oil is to be re-sampled and re-analysis for all the items is to be carried out immediately)
  - (b) Lubricating oil consumption rate: 2 *l/day* or less
  - (c) Temperature at aft. stern tube bearing: 55°C or less
  - (d) Wear down for oil lubricated bearing: 0.3 *mm* or less

Table 1 Standard criteria (Reference)

analytical items	max. values	analytical methods

<table>
<tr><td></td><td>Fe (*ppm*)</td><td>50</td><td>ICP (SOAP)</td></tr>
<tr><td></td><td>Sn (*ppm*)</td><td>20</td><td>ICP (SOAP)</td></tr>
<tr><td></td><td>Pb (*ppm*)</td><td>20</td><td>ICP (SOAP)</td></tr>
<tr><td></td><td>Na (*ppm*)</td><td>80</td><td>ICP (SOAP)</td></tr>
<tr><td></td><td>IR Oxidation @ 5.85 *μm* (Abs. *unit/cm*)</td><td>10</td><td>FT-IR</td></tr>
<tr><td></td><td>Separated Water (%)</td><td>1.0</td><td>Visual (24 settling hours)</td></tr>
<tr><td>5 After Approval</td><td colspan="3">(1) The parameters at least following **(a)** to **(e)** are to be monitored and recorded onboard the ship in accordance with the approved manual, and the lubricating condition of the propeller shafts is to be diagnosed thereby.
(a) Lubricating oil sampling and analysis is to be carried out regularly at intervals not exceeding 6 *months*, with at least the following **i)** to **iv)** being analyzed each time:
i) water content;
ii) salinity (sodium);
iii) content of shaft metal and bearing metal particles; and
iv) oxidation of oil.
(b) The monthly onboard checking of lubricating oil water content.
(c) Lubricating oil consumption rate
(d) Bearing temperature*1
(e) Weardown of the propeller shaft at the stern tube bearing
(2) Where any abnormality is found, management is to report it to the Society as soon as possible and withdraw the shaft for a thorough examination or carry out maintenance to the shaft as necessary.
(3) Management is to maintain onboard records of the analysis data in **4.(2)(b)** above after every analysis of the sample oil. In the documents, management's opinion, such as on the necessity for withdrawing the shaft, is to be included.
(4) The Society will carry out general examinations on the related shafting parts and review each record of parameters monitored at the ship's periodical surveys to verify that appropriate maintenance is carried out in compliance with the approved manual, and notify the ship's management of any necessary maintenance. Where any abnormality or improper maintenance is found out through the examination, management is required to apply for an Ordinary Survey of the shaft.</td></tr>
<tr><td>6 Cancellation of Approval</td><td colspan="3">(1) Where the following **(a)** to **(c)** is applicable, the Society may cancel the ship's approval to adopt the preventive maintenance system for propeller shafts. In such cases, the Society is to notify the ship's management of the cancellation, and the ship is to be carried out Ordinary Survey immediately in accordance with **Table ~~B2~~2.8.3**.
(a) Where any improper conduct is found regarding entries in the records such as those for oil analysis results.
(b) Where it is regarded by the Society that proper maintenance is not carried out according to the approved manual.
(c) Where the shipowner or ship management company has changed, or cancellation of the approval to adopt the preventive maintenance system has been requested by the ship's management.</td></tr>
</table>

Notes

*1: In the cases of azimuth thrusters which use roller bearings as the bearings for propeller shafts, however, the vibrations of the power transmission systems in the propulsion systems or the Fe-density of the lubricating oil in the azimuth thruster casings may be acceptable. In such cases, the instruments specified in **(1)** or **(2)** are used, the data and the result of the analysis are to be evaluated prior to the survey and are to be retained on board at all times. However, the following requirements specified in **(3)** are to be satisfied.

(1) A vibration measurement system to measure vibration of power transmission system in the azimuth thrusters complying with the following **(a)** to **(c)**. Where the system is fixed type, the environmental tests specified in **18.7.1(1), Part D of the Rules for the Survey and Construction of Steel Ships** are to be carried out.
  (a) The measurement is to be carried out regularly at intervals not exceeding 3 *months*.
  (b) Measurement points and the relevant data are to be in accordance with those described in the guidance for measurement in the management manual concerning the vibration measurement system.
  (c) A trend display and frequency analysis of the measurement data is to be provided.

(2) A Fe-density measurement system of lubricating oil in the azimuth thruster casings complying with the following **(a)** to **(c)**. Where the system is fixed type, the environmental tests specified in **18.7.1(1), Part D of the Rules for the Survey and Construction of Steel Ships** are to be carried out.
  (a) Sampling is to be carried out regularly at intervals not exceeding 3 *months*.
  (b) The measurement data is to be the amount of Fe per hour, considering the change of new lubricating oil. A trend display of the data is to be provided.
  (c) Sampling is to be carried out when the azimuth thrusters are operating at sea as far as possible. When the sampling can only be conducted at port, the sampling is to be carried out within 30 *minutes* after said thrusters stop.

1.4.3.1-1, Part 1, Part C of the Rules) which have been contracted for construction prior to 1 January 2004, a survey is to be carried out to verify compliance with the requirements specified in **(a)** and implementation schemes specified in **(b)**. (a) Requirements (i) **20.2.10, Part C of the Rules** applies to hatches on the exposed deck giving access to spaces forward of the collision bulkhead that also extend aft over this line. (ii) **23.6.8, Part C of the Rules** applies to ventilator pipes and their closing devices on the exposed deck serving spaces forward of the collision bulkhead that also extend aft over this line. (iii) **13.6.5, Part D of the Rules** applies to air pipes and their closing devices on the exposed deck serving spaces forward of the collision bulkhead that also extend aft over this line. (b) Implementation scheme (i) For ships which will be 15 *years* of age or more on 1 January 2004: by the due date of the first intermediate or special survey after that date (ii) For ships which will be 10 *years* of age or more but less than 15 *years* of age on 1 January 2004: by the due date of the first special survey after that date (iii) For ships which will be less than 10 *years* of age on 1 January 2004: by the date on which the ship reaches 10 *years* of age (Where the due date of the first intermediate or special survey is not until after the ship reaches 10	**1.4.3.1-1, Part 1, Part C of the Rules**) which have been contracted for construction prior to 1 January 2004, a survey is to be carried out to verify compliance with the requirements specified in **(a)** and implementation schemes specified in **(b)**. (a) Requirements **(i)** **20.2.10, Part C of the Rules** applies to hatches on the exposed deck giving access to spaces forward of the collision bulkhead that also extend aft over this line. **(ii)** **23.6.8, Part C of the Rules** applies to ventilator pipes and their closing devices on the exposed deck serving spaces forward of the collision bulkhead that also extend aft over this line. (iii) **13.6.5, Part D of the Rules** applies to air pipes and their closing devices on the exposed deck serving spaces forward of the collision bulkhead that also extend aft over this line. (b) Implementation scheme (i) For ships which will be 15 *years* of age or more on 1 January 2004: by the due date of the first intermediate or special survey after that date (ii) For ships which will be 10 *years* of age or more but less than 15 *years* of age on 1 January 2004: by the due date of the first special survey after that date (iii) For ships which will be less than 10 *years* of age on 1 January 2004: by the date on which the ship reaches 10 *years* of age (Where the due date of the first intermediate or special survey is not until after the ship reaches 10	

years of age, then the due date of the first intermediate or special survey) (5) (Deleted) (6) Secondary means of pressure/vacuum relief for controlled tank venting system for small chemical tanker For ships carrying dangerous chemicals in bulk of less than 500 *gross tonnage* which had been at the beginning stage of construction before 1 July 2002, a survey is to be carried out to verify compliance with the requirements of **8.2.3, Part S of the Rules** by the date of 1 January 2007. (7) With respect to the provisions of **8.1.2-3, Part I of the Rules**, ships built before 1 July 2007 and whose summer load line is located at a higher level than the *UIWL*, are to be provided with a warning triangle and with an ice class draught mark at the maximum permissible ice class draught amidships by the date of the first scheduled dry docking after 1 July 2007. In such cases, the engine output and the maximum and minimum ice class draught fore, amidships and aft are to be indicated in the classification certificate. (8) Safety practice of fixed carbon dioxide fire-extinguishing systems For fixed carbon dioxide fire-extinguishing systems for the protection of machinery spaces and cargo pump-rooms installed on ships which had been at the beginning stage of construction before 1 October 1994, a survey is to be carried out to verify compliance with the requirements of **25.2.2-2(1)** and **(2), Part R of the Rules** by the date of the first scheduled dry-docking after 1 January 2010. (9) Emergency towing procedures For cargo ships not less than 500 *gross tonnage*	*years* of age, then the due date of the first intermediate or special survey) (5) (Deleted) (6) Secondary means of pressure/vacuum relief for controlled tank venting system for small chemical tanker For ships carrying dangerous chemicals in bulk of less than 500 *gross tonnage* which had been at the beginning stage of construction before 1 July 2002, a survey is to be carried out to verify compliance with the requirements of **8.2.3, Part S of the Rules** by the date of 1 January 2007. (7) With respect to the provisions of **8.1.2-3, Part I of the Rules**, ships built before 1 July 2007 and whose summer load line is located at a higher level than the *UIWL*, are to be provided with a warning triangle and with an ice class draught mark at the maximum permissible ice class draught amidships by the date of the first scheduled dry docking after 1 July 2007. In such cases, the engine output and the maximum and minimum ice class draught fore, amidships and aft are to be indicated in the classification certificate. (8) Safety practice of fixed carbon dioxide fire-extinguishing systems For fixed carbon dioxide fire-extinguishing systems for the protection of machinery spaces and cargo pump-rooms installed on ships which had been at the beginning stage of construction before 1 October 1994, a survey is to be carried out to verify compliance with the requirements of **25.2.2-2(1)** and **(2), Part R of the Rules** by the date of the first scheduled dry-docking after 1 January 2010. (9) Emergency towing procedures For cargo ships not less than 500 *gross tonnage*	

engaged on international voyages which had been at the beginning stage of construction prior to 1 January 2010, a survey is to be carried out by 1 January 2012 to verify that the emergency towing procedures specified in **14.5.3, Part 1, Part C of the Rules** or **23.3, Part CS of the Rules** are provided. (10) In the case of ships not less than 500 *gross tonnage* engaged on international voyages which had been at the beginning stage of their construction before 1 January 2010 and have closed vehicle and Ro-Ro spaces equipped with fixed water pressure spraying systems, a survey is to be conducted to verify that the measures specified in **20.5.1-5, Part R of the Rules** have been carried out by the first survey after 1 January 2010. (11) Carriage of dangerous goods For cargo ships with cargo spaces intended for the carriage of packaged dangerous goods which are not less than 500 *gross tonnage* and had been at the beginning stage of construction on or after 1 September 1984 but before 1 January 2010 or which are less than 500 *gross tonnage* and had been at the beginning stage of construction on or after 1 February 1992 but before 1 January 2011, a survey is to be carried out to verify compliance with the requirement specified in **19.3, Part R of the Rules** in accordance with **Tables ~~19~~R19.1** and **~~19~~R19.3**, by the first special survey of the ship after 1 January 2011. However, the following provisions may apply: (a) Cargo ships not less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 September 1984 but before 1 July 1986 need not comply with **19.3.3, Part R of the Rules** provided that they comply	engaged on international voyages which had been at the beginning stage of construction prior to 1 January 2010, a survey is to be carried out by 1 January 2012 to verify that the emergency towing procedures specified in **14.5.3, Part 1, Part C of the Rules** or **23.3, Part CS of the Rules** are provided. (10) In the case of ships not less than 500 *gross tonnage* engaged on international voyages which had been at the beginning stage of their construction before 1 January 2010 and have closed vehicle and Ro-Ro spaces equipped with fixed water pressure spraying systems, a survey is to be conducted to verify that the measures specified in **20.5.1-5, Part R of the Rules** have been carried out by the first survey after 1 January 2010. (11) Carriage of dangerous goods For cargo ships with cargo spaces intended for the carriage of packaged dangerous goods which are not less than 500 *gross tonnage* and had been at the beginning stage of construction on or after 1 September 1984 but before 1 January 2010 or which are less than 500 *gross tonnage* and had been at the beginning stage of construction on or after 1 February 1992 but before 1 January 2011, a survey is to be carried out to verify compliance with the requirement specified in **19.3, Part R of the Rules** in accordance with **Tables 19.1** and **19.3,** by the first special survey of the ship after 1 January 2011. However, the following provisions may apply: (a) Cargo ships not less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 September 1984 but before 1 July 1986 need not comply with **19.3.3,**	

with the requirements which were in effect when such ships were constructed. (b) Cargo ships not less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 September 1984 but before 1 July 1998 need not comply with **19.3.10-1** and **19.3.10-2, Part R of the Rules**. (c) Cargo ships less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 February 1992 but before 1 July 1998 need not comply with **19.3.10-1** and **19.3.10-2, Part R of the Rules**. (d) Cargo ships not less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 February 1992 but before 1 July 2002 need not comply with **19.3.3, Part R of the Rules** provided that they comply with the requirements which were in effect when such ships were constructed. (e) Cargo ships not less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 September 1984 but before 1 July 2002 need not comply with **19.3.1**, **19.3.5**, **19.3.6** and **19.3.9, Part R of the Rules** provided that they comply with the requirements which were in effect when such ships were constructed. (12) Portable instruments for measuring oxygen concentrations For tankers which had been at the beginning stage of construction prior to 1 January 2012, a survey is to be carried out by the first survey on of after 1 January 2012 to verify that the portable instruments for measuring oxygen concentrations specified in	**Part R of the Rules** provided that they comply with the requirements which were in effect when such ships were constructed. (b) Cargo ships not less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 September 1984 but before 1 July 1998 need not comply with **19.3.10-1** and **19.3.10-2, Part R of the Rules**. (c) Cargo ships less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 February 1992 but before 1 July 1998 need not comply with **19.3.10-1** and **19.3.10-2, Part R of the Rules**. (d) Cargo ships not less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 February 1992 but before 1 July 2002 need not comply with **19.3.3, Part R of the Rules** provided that they comply with the requirements which were in effect when such ships were constructed. (e) Cargo ships not less than 500 *gross tonnage* which had been at the beginning stage of construction on or after 1 September 1984 but before 1 July 2002 need not comply with **19.3.1, 19.3.5, 19.3.6** and **19.3.9, Part R of the Rules** provided that they comply with the requirements which were in effect when such ships were constructed. (12) Portable instruments for measuring oxygen concentrations For tankers which had been at the beginning stage of construction prior to 1 January 2012, a survey is to be carried out by the first survey on of after 1 January 2012 to verify that the portable instruments for	

4.5.7(1), Part R of the Rules are equipped. (13) Devices to prevent the passage of flame (flame screen, flame arrester, detonation flame arrester and high velocity device) For devices to prevent the passage of flame required to ships which had been at the beginning stage of construction before 1 January 2013 and for ships which carry cargos shown as apparatus groups II*B*, II*C* or no apparatus group assigned in the column *i*” of **Table S17.1, Part S of the Rules**, a survey is to be carried out to verify that the devices are in compliance with the requirements of **7.4.2-2, Chapter 7, Part 6 of the Guidance for the Approval and Type Approval of Materials and Equipment for Marine ~~use~~Use** by the first scheduled dry-docking after 1 January 2013. (14) Means of recharging breathing apparatus cylinders and spare cylinders For ships at the beginning stage of construction prior to 1 July 2014, a survey is to be carried out by the first survey on or after 1 July 2014 to verify compliance with the requirements of **15.2.3, Part R of the Rules**. (15) Fire-fighter’s communication For ships at the beginning stage of construction prior to 1 July 2014, a survey is to be carried out by the first survey on or after 1 July 2018 to verify compliance with the requirements of **10.10.4, Part R of the Rules**. (16) Fire-fighter’s outfits For ships equipped with self-contained compressed air breathing apparatus of fire-fighter’s outfits which had been at the beginning stage of construction before 1 July 2014, a survey is to be carried out to verify that such apparatuses comply with the requirements of	measuring oxygen concentrations specified in **4.5.7(1), Part R of the Rules** are equipped. (13) Devices to prevent the passage of flame (flame screen, flame arrester, detonation flame arrester and high velocity device) For devices to prevent the passage of flame required to ships which had been at the beginning stage of construction before 1 January 2013 and for ships which carry cargos shown as apparatus groups II*B*, II*C* or no apparatus group assigned in the column *i*” of **Table S17.1, Part S of the Rules**, a survey is to be carried out to verify that the devices are in compliance with the requirements of **7.4.2-2**, **Chapter 7**, **Part 6 of the Guidance for the Approval and Type Approval of Materials and Equipment for Marine use** by the first scheduled dry-docking after 1 January 2013. (14) Means of recharging breathing apparatus cylinders and spare cylinders For ships at the beginning stage of construction prior to 1 July 2014, a survey is to be carried out by the first survey on or after 1 July 2014 to verify compliance with the requirements of **15.2.3, Part R of the Rules**. (15) Fire-fighter’s communication For ships at the beginning stage of construction prior to 1 July 2014, a survey is to be carried out by the first survey on or after 1 July 2018 to verify compliance with the requirements of **10.10.4, Part R of the Rules**. (16) Fire-fighter’s outfits For ships equipped with self-contained compressed air breathing apparatus of fire-fighter’s outfits which had been at the beginning stage of construction before 1 July 2014, a survey is to be carried out to verify that	

23.2.1-2(2), Part R of the Rules by the first survey on or after 1 July 2019. (17) Stability instruments for ships carrying dangerous chemicals in bulk For ships carrying dangerous chemicals in bulk which had been at the beginning stage of construction before 1 January 2016, a survey is to be carried out to verify compliance with the requirements of **2.2.3, Part S of the Rules** by the first scheduled special survey on or after 1 January 2016 but not later than 1 January 2021. (18) Stability instruments for ships carrying liquefied gases in bulk For ships carrying liquefied gases in bulk which had been at the beginning stage of construction before 1 July 2016, a survey is to be carried out to verify compliance with the requirements of **2.2.3, Part N of the Rules** by the first scheduled special survey on or after 1 July 2016 but not later than 1 July 2021. (19) Portable gas detector For vehicle carriers defined in **3.2.54, Part R** for the carriage of motor vehicles with compressed natural gas in their tanks for their own propulsion and/or motor vehicles with compressed hydrogen in their tanks for their own propulsion which had been at the beginning stage of construction before 1 January 2016, a survey is to be carried out to verify compliance with the requirements of **20A.5, Part R of the Rules** by the first survey on or after 1 January 2016. (20) Portable atmosphere testing instruments for enclosed spaces For ships of not less than 500 *gross tonnage* engaged on international voyages which had been at the beginning stage of construction before 1 July 2016, it	such apparatuses comply with the requirements of **23.2.1-2(2), Part R of the Rules** by the first survey on or after 1 July 2019. (17) Stability instruments for ships carrying dangerous chemicals in bulk For ships carrying dangerous chemicals in bulk which had been at the beginning stage of construction before 1 January 2016, a survey is to be carried out to verify compliance with the requirements of **2.2.3, Part S of the Rules** by the first scheduled special survey on or after 1 January 2016 but not later than 1 January 2021. (18) Stability instruments for ships carrying liquefied gases in bulk For ships carrying liquefied gases in bulk which had been at the beginning stage of construction before 1 July 2016, a survey is to be carried out to verify compliance with the requirements of **2.2.3, Part N of the Rules** by the first scheduled special survey on or after 1 July 2016 but not later than 1 July 2021. (19) Portable gas detector For vehicle carriers defined in **3.2.54, Part R** for the carriage of motor vehicles with compressed natural gas in their tanks for their own propulsion and/or motor vehicles with compressed hydrogen in their tanks for their own propulsion which had been at the beginning stage of construction before 1 January 2016, a survey is to be carried out to verify compliance with the requirements of **20A.5, Part R of the Rules** by the first survey on or after 1 January 2016. (20) Portable atmosphere testing instruments for enclosed spaces For ships of not less than 500 *gross tonnage* engaged on international voyages which had been at the	

is to be verified that portable atmosphere testing instruments complying with **1.5.1, Part B of the Rules** are provided on board by the first survey on or after 1 July 2016. (21) Ships operating in polar waters For ships operating in polar waters defined in **1.1.1-2, Part I of the Rules** at the beginning stage of construction before 1 January 2017, a survey is to be carried out to verify compliance with the requirements of **Chapter 1** (except for **1.1.1-4**, **1.1.1-5**, **1.1.2**, **1.1.3** and **1.1.4-2**) to **Chapter 7, Part I of the Rules** by the first Intermediate Survey or Special Survey after 1 January 2018, whichever occurs first. (22) Ships using low-flashpoint fuels (a) For ships that fall under the following **i)** or **ii)**, a survey is to be carried out to verify compliance with the requirements of **Part GF of the Rules** before using low-flashpoint fuels or undertaking to use different low-flashpoint fuels than specified: i) Ships which convert to using low-flashpoint fuels on or after 1 January 2017; or ii) Ships which, on or after 1 January 2017, undertake to use low-flashpoint fuels different from those which they were originally approved to use before 1 January 2017. (b) For ships that fall under the following **i)** or **ii)**, a survey is to be carried out to verify compliance with the requirements of **GF11.3.1-1**, **GF11.3.1-2**, **GF12.5.2-2** and **GF15.10.1, Part GF of the Guidance** before using low-flashpoint fuels or undertaking to use different low-flashpoint fuels than specified:	beginning stage of construction before 1 July 2016, it is to be verified that portable atmosphere testing instruments complying with **1.5.1, Part B of the Rules** are provided on board by the first survey on or after 1 July 2016. (21) Ships operating in polar waters For ships operating in polar waters defined in **1.1.1-2**, **Part I of the Rules** at the beginning stage of construction before 1 January 2017, a survey is to be carried out to verify compliance with the requirements of **Chapter 1** (except for **1.1.1-4**, **1.1.1-5**, **1.1.2**, **1.1.3** and **1.1.4-2**) to **Chapter 7, Part I of the Rules** by the first Intermediate Survey or Special Survey after 1 January 2018, whichever occurs first. (22) Ships using low-flashpoint fuels (a) For ships that fall under the following **i)** or **ii)**, a survey is to be carried out to verify compliance with the requirements of **Part GF of the Rules** before using low-flashpoint fuels or undertaking to use different low-flashpoint fuels than specified: i) Ships which convert to using low-flashpoint fuels on or after 1 January 2017; or ii) Ships which, on or after 1 January 2017, undertake to use low-flashpoint fuels different from those which they were originally approved to use before 1 January 2017. (b) For ships that fall under the following **i)** or **ii)**, a survey is to be carried out to verify compliance with the requirements of **GF11.3.1-1**, **GF11.3.1-2**, **GF12.5.2-2** and **GF15.10.1, Part GF of the Guidance** before using low-flashpoint fuels or	

i) Ships which convert to using low-flashpoint fuels on or after 1 July 2019; or ii) Ships which, on or after 1 July 2019, undertake to use low-flashpoint fuels different from those which they were originally approved to use before 1 July 2019. (c) For ships that fall under the following **i)** or **ii)**, a survey is to be carried out to verify compliance with the requirements of **11.8.1, Part GF of the Rules** and **GF11.3.1-2, Part GF of the Guidance** before using low-flashpoint fuels or undertaking to use different low-flashpoint fuels than specified: i) Ships which convert to using low-flashpoint fuels on or after 1 January 2024; or ii) Ships which, on or after 1 January 2024, undertake to use low-flashpoint fuels different from those which they were originally approved to use before 1 January 2024. (23) Inspection/survey plans for cargo containment systems for ships carrying liquefied gases in bulk (including programs of non-destructive testing for periodical surveys for independent tanks of Type *B* and programs of examination and testing of cargo containment systems for periodical surveys for membrane and semi-membrane tanks) For ships carrying liquefied gases in bulk which are at the beginning stage of construction on or after 1 July 2016, a survey is to be carried out to verify that the inspection/survey plans for cargo containment systems specified in **4.3.6, Part N of the Rules** are provided on board by the first survey on or after 1 July	undertaking to use different low-flashpoint fuels than specified: i) Ships which convert to using low-flashpoint fuels on or after 1 July 2019; or ii) Ships which, on or after 1 July 2019, undertake to use low-flashpoint fuels different from those which they were originally approved to use before 1 July 2019. (c) For ships that fall under the following **i)** or **ii)**, a survey is to be carried out to verify compliance with the requirements of **11.8.1, Part GF of the Rules** and **GF11.3.1-2, Part GF of the Guidance** before using low-flashpoint fuels or undertaking to use different low-flashpoint fuels than specified: i) Ships which convert to using low-flashpoint fuels on or after 1 January 2024; or ii) Ships which, on or after 1 January 2024, undertake to use low-flashpoint fuels different from those which they were originally approved to use before 1 January 2024. (23) Inspection/survey plans for cargo containment systems for ships carrying liquefied gases in bulk (including programs of non-destructive testing for periodical surveys for independent tanks of Type *B* and programs of examination and testing of cargo containment systems for periodical surveys for membrane and semi-membrane tanks) For ships carrying liquefied gases in bulk which are at the beginning stage of construction on or after 1 July 2016, a survey is to be carried out to verify that the inspection/survey plans for cargo containment	

2018. (24) Inspection/survey plans for liquefied gas fuel containment systems for ships using low-flashpoint fuels (including programs of non-destructive testing for periodical surveys for independent fuel storage tanks of Type *B* and programs of examination and testing of liquefied gas fuel containment systems for periodical surveys for membrane tanks) For ships which fall under the following, a survey is to be carried out to verify that the inspection/survey plans for liquefied gas fuel containment systems specified in **6.4.1-8, Part GF of the Rules** are provided on board by the first survey on or after 1 July 2018. (a) Ships using low-flashpoint fuels for which the building contract is placed on or after 1 January 2017; or (b) In the absence of a building contract, ships using low-flashpoint fuels which are at the beginning stage of construction on or after 1 July 2017; or (c) Ships using low-flashpoint fuels for which delivery is on or after 1 January 2021; or (d) Ships using low-flashpoint fuels which convert to using low-flashpoint fuels on or after 1 January 2017; or (e) Ships using low-flashpoint fuels which, on or after 1 January 2017, undertake to use low-flashpoint fuels different from those which it was originally approved to use before 1 January 2017.	systems specified in **4.3.6, Part N of the Rules** are provided on board by the first survey on or after 1 July 2018. (24) Inspection/survey plans for liquefied gas fuel containment systems for ships using low-flashpoint fuels (including programs of non-destructive testing for periodical surveys for independent fuel storage tanks of Type *B* and programs of examination and testing of liquefied gas fuel containment systems for periodical surveys for membrane tanks) For ships which fall under the following, a survey is to be carried out to verify that the inspection/survey plans for liquefied gas fuel containment systems specified in **6.4.1-8, Part GF of the Rules** are provided on board by the first survey on or after 1 July 2018. (a) Ships using low-flashpoint fuels for which the building contract is placed on or after 1 January 2017; or (b) In the absence of a building contract, ships using low-flashpoint fuels which are at the beginning stage of construction on or after 1 July 2017; or (c) Ships using low-flashpoint fuels for which delivery is on or after 1 January 2021; or (d) Ships using low-flashpoint fuels which convert to using low-flashpoint fuels on or after 1 January 2017; or (e) Ships using low-flashpoint fuels which, on or after 1 January 2017, undertake to use low-flashpoint fuels different from those which it was originally approved to use before 1 January 2017.	

Guidance for the survey and construction of steel ships Part B B1 B1.3.1-3

Correction	Present	Note
3 “Hatch covers and hatch coamings for cargo holds of ships stipulated otherwise by the Society” in **1.3.1(6)(b), Part B of the Rules** is as specified in the following **(1)** to **(4)**. (1) Hatch covers located forward of 0.25 L_1 from the forward end of L_1 of bulk carriers which are contracted for construction on or after 1 July 1998 and prior to 1 January 2004 and are at a beginning stage of construction prior to 1 January 2005 Renewal thickness ($t_{renewal}$) is given by the following formula. If a voluntary addition is included in the as built thickness, the value may be at the discretion of the Society. L_1 is the length of ship specified in **2.1.2, Part A of the Rules** or 0.97 *times* the length of ship on the designed maximum load line, whichever is smaller (m). $t_{renewal} = t_{as\text{-}built} - t_c + 0.5$ (mm) $t_{as\text{-}built}$: as built thickness (mm) t_c: Corrosion addition specified in **Table B1.3.1-1(a)** (2) Hatch covers and hatch coamings of bulk carriers not complying with the provisions of **Part CSR-B** or **Part CSR-B&T of the Rules**, and which are contracted for construction on or after 1 January 2004 or are at the beginning stage of construction on or after 1 January 2005; or ships other than bulk carries which are at the beginning stage of construction on or after 1 January 2005 and that have the application for Classification Survey during Construction submitted to the Society prior to 10 June 2005 Renewal thickness ($t_{renewal}$) is given by the following formula. If a voluntary addition is included in the as built thickness, the value may be at the discretion of the Society.	**3** “Hatch covers and hatch coamings for cargo holds of ships stipulated otherwise by the Society” in **1.3.1(6)(b), Part B of the Rules** is as specified in the following **(1)** to **(4)**. 4 Approval of PMS Conditions for approval of PMS are as follows: (1) Machinery maintenance scheme The machinery maintenance scheme for PMS is to specify maintenance works such as overhaul inspection, replacement of parts and general inspection with their time schedule and/or running hours for each item of machinery and equipment including their parts. The scheme is to be prepared based on the inspection and maintenance intervals recommended by the manufacturers of the machinery and equipment with input from the experience and knowledge of the shipowner and ship management company. The inspection intervals for all items covered by PMS are generally planned not to exceed 5 *years*. However, for the items whose overhaul intervals are specified on the basis of their running hours, longer intervals may be accepted as long as the intervals are based on the manufacturer's recommendations. When the machinery maintenance scheme is changed, the amended scheme is to be submitted to the Society for approval. (2) Survey Schedule Table Survey intervals of the survey items are not to exceed those specified in the machinery maintenance scheme. The following items are to be generally opened and examined in the presence of the Surveyor. (a) Rotors, casings, main bearings, couplings between turbine and reduction gear, nozzle valves and manoeuvring valves for main steam turbine (b) Auxiliary steam turbine for main generator	**4** Approval of PMS Conditions for approval of PMS are as follows: (1) Machinery maintenance scheme The machinery maintenance scheme for PMS is to specify maintenance works such as overhaul inspection, replacement of parts and general inspection with their time schedule and/or running hours for each item of machinery and equipment including their parts. 1 For the performance tests of the work-related installations of work-ships related to **15.2.3-1(1), Part B of the Rules**, the following tests are to be carried out. In cases where it is impractical to carry out such tests on board ship, they may be replaced with examinations carried out at the place of manufacture in the presence of a Surveyor. (1) Vessels engaged in towing operations (a) Confirmation that towing equipment is installed according to approved plans showing the arrangements of such equipment (b) Confirmation that towing equipment works well (2) Fire Fighting Vessels (a) Confirmation that fire fighting equipment is installed according to approved plans showing the arrangements of such equipment (b) Fire fighting equipment i) Water monitor systems Confirmation that the range of each monitor is more than that specified in **Table O6.4.2, Part O of the Guidance** in cases where all fixed water monitors are in simultaneous use ii) Hoses and nozzles for fire fighting Confirmation that water jet flows are more than 12*m* iii) Mobile high expansion foam generators Confirmation that mobile high expansion foam generators work well iv) Foam monitor systems Confirmation that the height of foam flow with all fixed foam monitors in simultaneous use at maximum foam generation is more than 15*m*	**1** For the performance tests of the work-related installations of work-ships related to **15.2.3-1(1), Part B of the Rules**, the following tests are to be carried out. Guidance for the survey and construction of steel ships Part C C35 C35.2.3-6

Correction	Present	Note
6 With respect to the provisions of **35.2.3-4(2)**~~(,),~~ **(4), (3)** and **(7), Part C of the Rules**, adjacent sections of a vertical ladder are to be in accordance with following **(1)** to **(3)**. (Refer to **Fig. C35.2.3-1**, **Fig. C35.2.3-2** and **Table C35.2.3**) (1) The minimum “lateral offset” between two adjacent sections of a vertical ladder is the distance between the sections, upper and lower, so that the adjacent stringers are spaced at least 200 *mm* apart, measured from half thickness of each stringer. (2) Adjacent sections of vertical ladder are to be installed so that the upper end of the lower section is vertically overlapped, in respect to the lower end of the upper section, to a height of 1,500 *mm* in order to permit a safe transfer between ladders. However, this requirement does not apply to cases where structural members (e.g. side stringers) are used to move between adjacent vertical ladders and are provided with safety measures such as handrails. (3) No section of the access ladder is to be terminated directly or partly above an access opening.	**6** With respect to the provisions of **35.2.3-4(2)**, **(4)**, **-5(3)** and **(7), Part C of the Rules**, adjacent sections of a vertical ladder are to be in accordance with following **(1)** to **(3)**. (Refer to **Fig. C35.2.3-1**, **Fig. C35.2.3-2** and **Table C35.2.3**) (1) The minimum “lateral offset” between two adjacent sections of a vertical ladder is the distance between the sections, upper and lower, so that the adjacent stringers are spaced at least 200 *mm* apart, measured from half thickness of each stringer. (2) Adjacent sections of vertical ladder are to be installed so that the upper end of the lower section is vertically overlapped, in respect to the lower end of the upper section, to a height of 1,500 *mm* in order to permit a safe transfer between ladders. However, this requirement does not apply to cases where structural members (e.g. side stringers) are used to move between adjacent vertical ladders and are provided with safety measures such as handrails. (3) No section of the access ladder is to be terminated directly or partly above an access opening.	Wording correction

1 Classification of Loads (1) The loads due to the longitudinal bending moment of hull girders at the forward and aft end boundaries of the structure model may, as a rule, not be taken into consideration. When these loads are taken into consideration, however, the allowable stress to be applied to the results of calculations is to be determined as deemed appropriate by the Society. (2) The design loads to be taken into consideration are, as a rule, to be the loads due to cargo and water ballast loaded on board, hydrostatic pressure and wave loads. (3) The load due to the inertial force of cargo is to be considered in addition to those specified in **(2)** above, when the Society considers it is necessary. (4) Special consideration is to be made for cargo holds where dynamic impact loads such as sloshing loads are predicted, and proper data in this regard is to be submitted. (5) The loads for oil tankers, ore carriers and bulk carriers are to be in accordance with the requirements specified in **C29.6.2 of**, **C30.1.2** and **C31.1.5 of the Guidance** respectively, in addition to those found here in **1.2**. When deemed necessary by the Society, other loading conditions described in the Loading Manual are also to be considered.	**1** Classification of Loads (1) The loads due to the longitudinal bending moment of hull girders at the forward and aft end boundaries of the structure model may, as a rule, not be taken into consideration. Guidance for the survey and construction of steel ships Part D D13 D13.8.5-3

Correction	Present	Note
3 The wording “the systems to have constructions and functions deemed appropriate by the Society” in **13.8.5-1(4), Part D of the Rules** means those systems complying with the following requirements and being of a type approved by the Society in accordance with **Chapter 5, Part 7 of** Guidance for **the Approval and Type Approval of Materials and Equipment for Marine Use** or those systems approved by an organisation deemed appropriate by the Society in accordance with the Resolution *MSC.*188(79), as amended. (1) The systems are to have sufficient corrosion resistance with consideration being given to the locations where the systems are to be installed and are to be maintain their functionality under expected service temperatures. In addition, any parts of the systems which may be exposed to cargo or bilge containing cargo, such as detectors, etc., are to be sufficiently able to cope with different conditions such as acidity, alkalinity, dust, etc. with consideration being given to the intended cargoes. (2) Protection of the enclosures of electrical components for the systems is to satisfy the following **(a)** to **(c)**: (a) The requirements of IP68 for those installed in spaces, tanks or cargo holds. This includes all adjacent spaces considered to be simultaneously flooded under damage stability calculations of the spaces/tanks/cargo holds required by the provisions of **2.3, Part 1, Part C of the Rules** or the requirements for ships to be assigned reduced freeboard in accordance with **Part V of the Rules**; (b) The requirements of IP56 for those installed on	**3** The wording “the systems to have constructions and functions deemed appropriate by the Society” in **13.8.5-1(4), Part D of the Rules** means those systems complying with the following requirements and being of a type approved by the Society in accordance with **Chapter 5, Part 7 of the Approval and Type Approval of Materials and Equipment for Marine Use** or those systems approved by an organisation deemed appropriate by the Society in accordance with the Resolution *MSC.*188(79), as amended. exposed decks above the spaces/tanks/cargo holds; and (c) The provisions of **Part H of the Rules** for any of those not specified in **(a)** or **(b)** above. (3) Electrical installations for the systems installed in the following areas are to be of an intrinsically safe type or safe type of an appropriate apparatus group and temperature class suitable for the cargo carried, and the maximum surface temperature of the installations is not to exceed 85℃, except electrical installations installed in ships designed only to carry cargo which are not combustible or explosive atmosphere. In addition, in cases where a ship is designed to carry only limited kinds of cargo, the maximum surface temperature may be appropriately relaxed depending on the kind of cargo. In this case, such limitations relating to cargo are to be documented in booklets for cargo operations. Finally, those electric installations installed at the edges of the following areas are to be approved at the discretion of the Society with due consideration being given to their design with respect to gas-tightness, etc. (a) Cargo holds (b) Enclosed spaces adjacent to cargo holds having openings without a gas-tight or watertight door/hatch and the like into a hold (c) Areas within 3 *m* of any cargo hold mechanical exhaust ventilation outlet (4) For electrical installations for the systems which are installed in ships intended for carrying dangerous goods, the provisions of **Chapter 19, Part R of the Rules** are to be referred to. (5) Detectors are to be capable of indicating water level within an accuracy of ±100 *mm*. Time delays are to be	exposed decks above the spaces/tanks/cargo holds; and (c) The provisions of **Part H of the Rules** for any of those not specified in **(a)** or **(b)** above. (3) Electrical installations for the systems installed in the following areas are to be of an intrinsically safe type or safe type of an appropriate apparatus group and temperature class suitable for the cargo carried, and the maximum surface temperature of the installations is not to exceed 85℃, except electrical installations installed in ships designed only to carry cargo which are not combustible or explosive atmosphere. In addition, in cases where a ship is designed to carry only limited kinds of cargo, the maximum surface temperature may be appropriately relaxed depending on the kind of cargo. In this case, such limitations relating to cargo are to be documented in booklets for cargo operations. (5) Detectors are to be capable of indicating water level within an accuracy of ±100 *mm*. Time delays are to be	

so incorporated into alarm systems, in order to prevent spurious alarms due to any sloshing effects associated with ship motion, so that alarms will activate after detecting water level continuously for a standard period of not less than 10 *seconds*. The accuracy of these detectors may be set on the basis of seawater density. (6) The systems are to be of a continuously self-monitoring type that also monitors any detectors. Audible and visual alarms are to be activated when any faults are detected. In this requirement, the term "fault" refers to problems such as open circuits, short circuits, loss of power supplies and CPU failures. The audible alarms are to be capable of being muted. However, visual alarms are to remain active until the malfunction has been cleared and such alarms are not to be capable of being turned off by hand. In addition, the systems are to be provided with means for testing their respective detectors when holds are empty. (7) Alarm panels for the systems are to be provided with a switch for the testing of all audible and visual alarms. This switch is to return to the off position automatically when not being operated. (8) The systems are to be supplied with electrical power from two independent sources. Any failure of two electrical power supplies is to be indicated by an alarm on the navigation bridge. In cases where secondary electrical power is supplied by dedicated batteries, such batteries are to be in accordance with the following **(a)** to **(c)**: (a) Batteries are to have a capacity for a period of at least 18 *hours* and they are to be continuously charged; (b) Batteries are to be arranged and located in	so incorporated into alarm systems, in order to prevent spurious alarms due to any sloshing effects associated with ship motion, so that alarms will activate after detecting water level continuously for a standard period of not less than 10 *seconds*. 					Air cooling and subsequent water cooling after heating	900°C or below (Starting temperature of water cooling is to be 500°C or below)	*KE*32 *KE*36	0.38% or below	Water cooling just after heating	900°C or below	More than 0.36%	Air cooling and subsequent water cooling after heating	900°C or below (Starting temperature of water cooling is to be 500°C or below)
									Air cooling after heating		0.36% or below		900°C or below (Starting temperature of water cooling is to be 550°C or below)

Notes:

(1) In *KA*40, *KD*40, *KE*40 and *KE*47, the control standards for the conventional high tensile steels are applied except for the case specially approved by the Society. *KF*32, *KF*36 and *KF*40 are to be as deemed to appropriate by the Society.

(2) The conventional type is the high tensile steel of which grades of heat treatment specified in Notes (3) of **Table K3.3, Part K of the Rules,** as other than the *TMCP* type.

(3) C_{eq} is to be calculated by the following formula and is to be rounded to two decimal places.

$$C_{eq} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \ (\%)$$

(4) The control standards when the value of C_{eq} exceeds the value in this Table, in principle, are to be applied as conventional type.

(5) When there are differences in C_{eq} of the steel materials, the control standard corresponding to the higher value of C_{eq} is to be applied.

(6) The length of bead is to be measured from the starting point of weld to the centre of the crater at the termination of the weld.

(7) Where cold cracking susceptibility P_{cm} is substituted for C_{eq}, the control standards are to be as deemed to appropriate by the Society. P_{cm} is to be calculated by the following formula and is to be rounded to two decimal places.

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B \ (\%)$$

(8) It is recommended that for *KE*32 and *KE*36 to be not less than 30 *mm*.

(9) Even in cases where the temperature exceeds the value given in this Table, preheating may be required depending on the thickness of steel materials, degree of restrain and welding heat input.

(10) Electrodes are to be of the low hydrogen electrodes. However, in horizontal butt welding, overhead fillet welding, etc., extremely low hydrogen electrodes (the quantity of hydrogen measured by the glycerine replacement method is not more than 0.03 cm^3/g) is to be used, or in cases the temperature exceeds the value in this Table. Preheating is to be carried out.

(11) It is recommended that the conventional control standards for the conventional high tensile steels are applied to *KE*.

(12) For *KE*47, in the cases where P_{cm} is less than or equal to 0.19, 25 *mm* of short bead length and air temperature of 0°C or below may be adopted where

approved by the Society. (13) These control standards apply to *KL*24*A*, *KL*24*B*, *KL*27, *KL*33 and *KL*37. The standards for other grades are to be as deemed appropriate by the Society. (14) For steels considered to have brittle crack arrest properties specified in **3.12, Part K of the Rules**, the control standards for the steels excluding “*BCA*6000” or “*BCA*8000” given in **Table K3.40** or **Table K3.41, Part K of the Rules**, are to be applied.

Guidance for the survey and construction of steel ships Part N Annex 5 Chapter 2 2.2

Correction	Present	Note
The following procedures will demonstrate the adequacy of a tank vent system to limit the pressure rise in a cargo tank to not greater than 120% of *MARVS* during all conditions, including fire conditions implicit in **8.4~~,~~.1, Part N of the Rules**. (1) Prepare a simplified flow sheet of the cargo tank vent system, identifying the fittings and the actual diameters and lengths of pipe. (*See* **Fig. 1**) Divide the system into sections between nodes at changes in pipe diameter and at interconnections with flows from other relief valves. List the fittings and their dynamic loss coefficients. Calculate the external surface area of the piping sections between the nodes. (*See* **Table 2**) (2) Calculate the *PRV* capacity (Q_{GCC}) of each tank *PRV*, in m^3/s of air at standard conditions in accordance with **8.4.1, Part N of the Rules** and note the installed rated capacity (Q_{IR}) of each *PRV* in m^3/s air at standard conditions at 120% of *MARVS*. The calculation should be done for the highest gas factor of the products included in the cargo list. Determine the mass flows for cargo conditions at 120% of *MARVS* through each *PRV* for the *PRV* capacity and for the installed rated capacity for both all vapour flow and for two-phase cargo flow. Also calculate the mass flow at *MARVS* for the installed rated capacity on all vapour flow. Equation (1) may be used for all vapour mass flow and equations (2), (3) and (4) may be used for two-phase mass flow. (3) Estimate all the vapour flow pressure drop at 120% of *MARVS* in the pipe from the cargo tank connection to the *PRV* inlet flange, working from the known tank	The following procedures will demonstrate the adequacy of a tank vent system to limit the pressure rise in a cargo tank to not greater than 120% of *MARVS* during all conditions, including fire conditions implicit in **8.4,1 Part N of the Rules**. (1) Prepare a simplified flow sheet of the cargo tank vent system, identifying the fittings and the actual diameters and lengths of pipe. (*See* **Fig. 1**) Divide the system into sections between nodes at changes in pipe diameter and at interconnections with flows from other relief valves. pressure towards the *PRV*. This pressure drop is calculated by using the difference in stagnation pressures. Therefore, the second term of equation (5) may be used for pipe sections of constant diameter. For contractions, equation (5.1) may be used. (4) Check that the pressure drop at each *PRV* inlet complies with **2.1-3(1)** at the *PRV* capacity for all vapour flow to assure adequate relief capacity. For the calculation, the vapour mass flow of product (W_g) from equation (1) should be used. (5) Estimate the two-phase flow pressure in the discharge pipe at the location of discharge to the atmosphere. Equation (6) may be used, with the *PRV* two-phase mass flow (W', equation (4)) to assure adequate relief capacity, to check if the exit pressure is greater than 1 *bar a*. (6) Estimate the vapour fraction and two-phase density in the vent pipe at the exit to the atmosphere, assuming transfer of the fire heat flux of 108 kW/m^2 through the uninsulated vent piping. (*See* **2.3-7**, the same being referred to hereinafter) Equations (7) and (8) may be used. (7) Estimate the built-up back pressure at the *PRV* outlet flange, commencing from the known vent pipe exit pressure, calculating the pressure drop between pipe nodes and working, section by section, back up the pipe to the *PRV*. Equations (7), (8), (9) and (5) may be used with iteration until the upstream node absolute pressure, vapour fraction and specific volume are justified and assuming that vapour is saturated. At pipe diameter expansion fittings where fluid velocity is reduced, a pressure recovery generally occurs. This recovery is overestimated in case of two-	pressure towards the *PRV*. This pressure drop is calculated by using the difference in stagnation pressures. Therefore, the second term of equation (5) may be used for pipe sections of constant diameter. For contractions, equation (5.1) may be used. (4) Check that the pressure drop at each *PRV* inlet complies with **2.1-3(1)** at the *PRV* capacity for all vapour flow to assure adequate relief capacity. For the calculation, the vapour mass flow of product (W_g) from equation (1) should be used. (5) Estimate the two-phase flow pressure in the discharge pipe at the location of discharge to the atmosphere. Equation (6) may be used, with the *PRV* two-phase mass flow (W', equation (4)) to assure adequate relief capacity, to check if the exit pressure is greater than 1 *bar a*. (6) Estimate the vapour fraction and two-phase density in the vent pipe at the exit to the atmosphere, assuming transfer of the fire heat flux of 108 kW/m^2 through the uninsulated vent piping. (*See* **2.3-7**, the same being referred to hereinafter) Equations (7) and (8) may be used. (7) Estimate the built-up back pressure at the *PRV* outlet flange, commencing from the known vent pipe exit pressure, calculating the pressure drop between pipe nodes and working, section by section, back up the pipe to the *PRV*. Equations (7), (8), (9) and (5) may be used with iteration until the upstream node absolute pressure, vapour fraction and specific volume are justified and assuming that vapour is saturated. At pipe diameter expansion fittings where fluid velocity is reduced, a pressure recovery generally occurs. This recovery is overestimated in case of two-	

phase flow when dynamic loss coefficients for single-phase flow are used. For the purpose of these guidelines, the static exit pressure of a conical expansion fitting is assumed to be equal to the static inlet pressure. (8) Estimate the choking pressure (p_{ec}) at the exit of every section with the mass-flux (G_p) in that section for the pipeline between the *PRV* and the vent exit. Equation (6) may be used. Compare the pressure distribution along the vent line as derived from item **2.2(5)** to **2.2(7)**, with the different choking pressures for each section as derived from equation (6). If choking pressure at any location exceeds the corresponding calculated pressure derived from **2.2(5)** to **2.2(7)**, the calculation as described in **2.2(5)** to **2.2(7)** should be repeated commencing from choking point location and corresponding choking pressure, working back up the pipe to the *PRV*. If choking pressure at more than one location exceeds the corresponding calculated pressure derived from **2.2(5)** to **2.2(7)**, the commencing point of the recalculation should be taken as the choking location point giving the highest built-up back pressure. (9) Check that the built-up back pressure at each *PRV* outlet complies with **2.1-4**, at the *PRV* capacity for two-phase mass flow (W', equation (4)) at 120% of *MARVS*, to assure stable operation of the valves, thus assuring adequate relief capacity.	phase flow when dynamic loss coefficients for single-phase flow are used. For the purpose of these guidelines, the static exit pressure of a conical expansion fitting is assumed to be equal to the static inlet pressure. (8) Estimate the choking pressure (p_{ec}) at the exit of every section with the mass-flux (G_p) in that section for the pipeline between the *PRV* and the vent exit. Equation (6) may be used. Compare the pressure distribution along the vent line as derived from item **2.2(5)** to **2.2(7)**, with the different choking pressures for each section as derived from equation (6). If choking pressure at any location exceeds the corresponding calculated pressure derived from **2.2(5)** to **2.2(7)**, the calculation as described in **2.2(5)** to **2.2(7)** should be repeated commencing from choking point location and corresponding choking pressure, working back up the pipe to the *PRV*. If choking pressure at more than one location exceeds the corresponding calculated pressure derived from **2.2(5)** to **2.2(7)**, the commencing point of the recalculation should be taken as the choking location point giving the highest built-up back pressure. (9) Check that the built-up back pressure at each *PRV* outlet complies with **2.1-4**, at the *PRV* capacity for two-phase mass flow (W', equation (4)) at 120% of *MARVS*, to assure stable operation of the valves, thus assuring adequate relief capacity.

<table>
<tr><th>Applicable provisions</th><th>Worked example of the procedure</th></tr>
<tr><td>2.2(1)</td><td>Fig.~~Figure~~ 1 is a simplified flow sheet of a cargo tank vent system with one vent stack connected to two tanks. The system has been divided into sections between nodes, marked by capital letters A to N, at changes in pipe diameter and at interconnections with flows from other relief valves at F and J. Table 2 lists the vent pipe lengths and external surface areas, the fittings in the vent system and
their Friction Resistance Factors. Table 3 gives some typical values for Friction Resistance
Factors (<i>N</i>). <i>N</i> may vary with pipe diameter.</td></tr>
<tr><td>2.2(2)</td><td>The minimum tank relief capacity of the Rules, Q_{GCC}, is calculated for the ship tank which has an external surface area of 747 m^2 and <i>MARVS</i> of 11.0 <i>bar g</i>.
By 8.4.1, Part N of the Rules for propane:
for 1.2・<i>MARVS</i> = 11.0・1.2＋1.0 = 14.2 <i>bar a</i>
$L = 308.6$ <i>kj/kg</i>
$T = 273 + 41 = 313^{\circ}$ <i>K</i>
$D = 0.635$, for $k = 1.13$
$Z = 1.0$
$M = 44$
$A^{0.82} = 227.05$
$F = 0.2$
$$Q_{GCC} = 0.2 \cdot \frac{12.4}{308.6 \cdot 0.635} \cdot \sqrt{\left(\frac{1.0 \cdot 314}{44}\right)} \cdot 227.05 = 7.68\ m^3/s \text{ of air at } STP$$
The Q_{GCC} for the actual case study ship tank = 7.71 m^3/s of air at standard conditions (STP) of 273° <i>K</i> and 1.013 <i>bar a</i>.
The installed rated capacity for two 75 <i>mm</i>×100 <i>mm</i> AGCo Type 95 <i>POPRV</i>s
Q_{IR} = 20.52 m^3/s of air at standard conditions (STP).
or 20.52/7.71 = 2.66 times the Q_{GCC}
By equation (1) for all vapour mass flow rate from tank for propane:
where h_{fg} at 1.2・<i>MARVS</i> = 308600 <i>J/kg</i>
$$W_g = \frac{71000 \cdot 0.2 \cdot 227.05}{308600} = 10.44\ kg/s$$
or <i>PRV</i> all vapour mass flow rate per <i>PRV</i> = 5.22 <i>kg/s</i>
and installed rated all vapour mass flow rate per <i>PRV</i> = 5.22・2.66 = 13.89 <i>kg/s</i>
where h_{fg} at <i>MARVS</i> = 322800<i>J/kg</i>
$$W_g = \frac{71000 \cdot 0.2 \cdot 227.05}{322800} = 9.99 kg/s$$</td></tr>

		By equation (4) for two-phase mass flow rate through provided *PRV* At 1.2 ・ *MARVS*: $W = 28.25 \cdot 7.71/20.52 = 10.6$ *kg/s*		
	2.2(3)	The all vapour capacity and two-phase pressure drops in the pipe from the cargo tank to the *PRV* inlet are calculated as the difference in stagnation pressures by using the second term of equation (5) for pipe sections of constant diameter and by using equation (5.1) for conical reduction fittings (contractions). (1) For provided *PRV* all vapour capacity at 1.2 ・ *MARVS* Section N to M: $\Delta p = 0.5 \cdot 665^2 \cdot 0.0330 \cdot 0.528 = 3900$ *P*a (0.039 *bar*) where from **Table 2**: $G_p = 5.22/\pi \cdot 0.1^2/4 = 665$ *kg/m²s* ; $4f \cdot L/D + N = 0.528$ $v = 0.0330$ *m³/kg* with incompressible flow assumed Conical reduction fitting M: where $G_p = 5.22/\pi \cdot 0.08^2/4 = 1038$ *kg/m²s*; $N = 0.1$ $\Delta p = 0.5 \cdot 1038^2 \cdot 0.0330 \cdot 0.1 = 1800$ *Pa* (0.018 *bar*) Section M to PRV: $\Delta p = 0.5 \cdot 1038^2 \cdot 0.0330 \cdot 0.027 = 500$ *Pa* (0.005 *bar*) here and from **Table 2** $G_p = 1038$ *kg/m²s* ; $4f \cdot L/D + N = 0.027$ Section N to *PRV* total $\Delta p = 0.039 + 0.018 + 0.005 = 0.06$ *bar* (2) For installed rated all vapour capacity at *MARVS* Section N to M: $\Delta p = 0.5 \cdot 1689^2 \cdot 0.0392 \cdot 0.528 = 29500$*Pa* (0.295 *bar*) here $G_p = 1689$ *kg/m²s* ; $v = 0.0392$ *m³/kg* with incompressible flow assumed Conical reduction fitting M: $\Delta p = 0.5 \cdot 2640^2 \cdot 0.0392 \cdot 0.1 = 13700$*Pa* (0.137 *bar*) here, $G_p = 2640$ *kg/m²s* Section M to *PRV*: $\Delta p = 0.5 \cdot 2640^2 \cdot 0.0392 \cdot 0.027 = 3700$*Pa* (0.037 *bar*) here, $G_p = 2640$ *kg/m²s* Section N to *PRV* total $\Delta p = 0.295 + 0.137 + 0.037 = 0.47$ *bar*		

	2.2(4)	Check system compliance with requirements of **2.1-3~~.(~~(1)** At divided *PRV* all vapour capacity at 1.2・*MARVS* $\Delta p \cdot 100/p_{MARVS}$ = 0.06・100/11.0 = 0.55% ≤ 3% For requirement of **2.1-3~~.(~~(2)** At divided *PRV* two-phase capacity at 1.2・*MARVS* = 0.016・100/11.0=0.15% At installed rated all vapour capacity at *MARVS* = 0.47・100/11.0=4.27% At installed rated two-phase capacity at *MARVS* = 0.10・100/11.0=0.91% $\Delta p_{close} > 0.02\ p_{MARVS} + \Delta p_{inlet}$ $>$ 0.02・11.0 + 0.47 $>$ 0.69 *bar* For stable operation of the *PRV*, closing pressure should be less than: 11.0 - 0.69 ≤ 10.31 *bar g* for a pop-action *POPRV*		
	2.2(5)	The two-phase critical exit choking pressure is estimated, using saturated propane properties at 1.2・*MARVS* (14.2 *bar a*) By equation (6) where $\omega = \frac{466.2\cdot2931\cdot314\cdot1420000\cdot(0.0330-0.0021)^2}{(832800-52400)^2}$ = 6.09 and where W' for Code discharge from four *PRV*s = 10.6・4 = 42.4 *kg/s* ; D_{exit}=0.5 *m* ; $G_p = \frac{42.4}{\pi\cdot0.5^2/4}$= 215.9 *kg/m²s* $p_{ec} = 215.9 \cdot \left[\frac{1420000\cdot6.09}{466.2}\right]^{1/2}$ = 215.9・136.2 = 29400 *Pa* (0.29 *bar a*) Thus the exit flow is not choked and the vent pipe exit pressure is 100000 *Pa* (1 *bar a*)		
	2.2(6)	The exit vapour fraction,x_e, assuming a fire exposure heat flux of 108 *kW/m²* into uninsulated vent discharge piping at the Code rated two-phase flow rate, is estimated. By equation (7) and from ~~Table2~~**Table 2**: $\sum \frac{a}{W} = \frac{27.86+4.50}{42.4} + \frac{1.81}{21.2} + \frac{1.72}{10.6}$= 1.011 *m²s/kg* and $x_e = \frac{524200-320300+108000\cdot1.011}{425200}$= 0.74 By equation (8) and (9) ρ_e= 3.14 *kg/m²* and v_e= 0.319 *m²s/kg*		

	2.2(7) **2.2(8)** **2.2(9)**	The pressure drops between the vent discharge piping nodes are estimated by equation (5), with iteration until the upstream node absolute pressure, vapour fraction and specific volume are justified, and working section by section back up the pipe to the *PRV*. Section BA Section B to A and from ~~Table2~~**Table 2**: $G_p = 4 \cdot 10.6/\pi \cdot 0.5^2/4$ = 215.9 *kg/m²s* By first approximation Δp = 0.5 ・ 215.9^2 ・ 0.319 ・ 2.313= 17200 *Pa* (0.17 *bar*) Try p_B = 1.18 *bar a* By equation (7) and from ~~Table2~~**Table 2**: $\sum a\big/W$= 27.86/42.4 + 1.81/21.2 + 1.72/10.6 = 0.9048 m^2s/kg and $x_B = \frac{524200-328700+108000\cdot0.9048}{421600}$= 0.70 By equation (8) and (9) ρ_B= 2.73/0.70 = 3.90 kg/m^3 ; v_B= 0.256 m^2s/kg By equation (5) $\Delta p = 215.9^2$ ・ (0.319 - 0.256) + 0.5 ・ 215.9^2 (0.319 + 0.256)/2 ・ 2.313 = 2900 + 15500 = 18400 *Pa* (0.18 *bar*) and p_B = 1.18 *bar a* By **2.2(8)** and p_{ec} at B = 337.3 ・ 136.2 = 46000 *Pa* (0.46 *bar a*) using mass flux at exit from section F to B Section FB Section F to B and from ~~Table2~~**Table 2**: where $G_p = 4 \cdot 10.6/\pi \cdot 0.4^2/4$= 337.3 *kg/m²s* By first approximation Δp = 0.5 ・ 337.3^2 ・ 0.256 ・ 1.808= 26300 *Pa* (0.26 *bar*) By equation (7) and from ~~Table2~~**Table 2**:		
		where $\sum a\big/W$= 1.81/21.2 + 1.72/10.6 = 0.2477 m^2s/kg and $x_F = \frac{524200-343300+108000\cdot0.2477}{412600}$= 0.50 By equation (8) and (9) ρ_F = 3.45/0.50 = 6.90 kg/m^3 ; v_F = 0.145 m^3/kg By equation (5) $\Delta p = 337.3^2$(0.256 - 0.145) + 0.5 ・ 337.3^2 (0.256 + 0.1456)/2 ・ 1.808 = 12600 + 20600 = 33200 *Pa* (0.33 *bar*) and p_F = 1.18 + 0.33 = 1.51 *bar a* Section GF		

Section G to F and from ~~Table2~~**Table 2**:
where $G_p = 2 \cdot 10.6/\pi \cdot 0.4^2/4$= 168.7 kg/m^2s
By first approximation Δp = 0.5 • 168.7^2 • 0.145 • 1.132 = 2300 *Pa* (0.02 *bar*)

This pressure drop is too small to justify a more accurate estimation. For the purposes of this calculation, we can assume the specific volume remains constant from G to L.

Section JG

Section L to J and from ~~Table2~~**Table 2**:
where $G_p = 2 \cdot 10.6/\pi \cdot 0.3^2/4$= 299.9 kg/m^2s
By first approximation Δp = 0.5 • 299.9^2 • 0.145 • 0.071 = 500 *Pa* (0.01 *bar*)

Section LJ

Section L to J and from ~~Table2~~**Table 2**:
$G_p = 10.6/\pi \cdot 0.3^2/4$= 149.9 kg/m^2s
By first approximation Δp = 0.5 • 149.9^2 • 0.145 • 0.621= 1000 *Pa* (0.01 *bar*)
p_L= 1.51 + 0.02 + 0.01 + 0.01 = 1.55 *bar a* at exit from conical expansion fitting
By equation (7)

$$x_L = \frac{524200-344600+0}{415800} = 0.432$$

By equations (8) and (9)
ρ_L= 3.54/0.432 = 8.19 kg/m^3 ; v= 0.122 m^2s/kg

Conical expansion fitting at L

In accordance with procedure 2.2-7, the static inlet pressure to this fitting is assumed to be 1.55 *bar a*.

Section *PRV* - L

Section PRV and from ~~Table2~~**Table 2**:
where $G_p = 10.6/\pi \cdot 0.1^2/4$= 1349.9 kg/m^2s
p_{ec} at exit of pipe section from PRV to L = 1349 • 136.2 = 184000 *Pa* (*1.84 bar a*) > 1.55
Therefore, the exit of the 100 *mm* diameter pipe section *PRV* to L is choked and the exit pressure at L is 1.84 *bar a*.
By equation (7) at 1.84 *bar a*

$$x_L = \frac{524200-355100+0}{411600} = 0.411$$

By equation (8) and (9)
ρ_L= 4.18/0.411 = 10.17 kg/m^3 ; v_L= 0.098 m^2s/kg
By first approximation Δp = 0.5 • 1349^2 • 0.098 • 0.043= 3800 *Pa* (0.04 *bar*)
p_{PRV} = 1.84 + 0.04 = 1.88 *bar a* ; Try 2.42 *bar a*
By equation (7)

		$x_{PRV} = \frac{524200-371800}{403600}$= 0.378		
		By equation (8) and (9) ρ_{PRV}= 5.49/0.378 = 14.52 *kg/m*^{3} ; v_{PRV}= 0.069 *m*^{2}*s/kg* By equation (5) *Δ p*= 1349^2・(0.098 - 0.069) + 0.5・1349^2 (0.098 + 0.069)/2・0.043 = 52800 + 3300 = 56100 *Pa* (0.56 *bar*) and p_{PRV} = 1.84 + 0.56 = 2.40 *bar a* (1.40 *bar g*) Back pressure at divided *PRV* two-phase flow at 14.2 *bar a* is 1.40×100/11.0 = 12.7% of set pressure (gauge) which assures adequate relief capacity for *POPRV*s.		
	Summary of predictions	The predicated two-phase propane properties are shown at five node points in the *PRV* discharge vent piping, in **Fig. 2** at the divided *PRV* flow-rate, and in **Table**~~**Fig.**~~ **3** at the installed rated flow-rate. The flowing pressure drop in the piping to the *PRV* inlet is less than **2.1-3.** The built-up back pressure at the *PRV* outlet is also less than **2.1-4** requires for the pilot-operated *PRV*s installed.

One set of these is , to be stored in the locker near the cargo pump room at all times. The construction of the special locker for the storage of protective equipment provided in the cargo area is to comply with the requirement in **~~Chapter 19~~11.3.3, Part 1, Part C of the Rules**. When this can not be complied with under avoidable reasons, protective equipment may be stored in the store or locker having no openings to accommodation space and service space and located outside the cargo area as shown in **Fig. S14.1.2-1**. This requirement does not apply to brand new protective equipment, unused equipment, or equipment which has not been used since undergoing a through cleaning process.	The protective equipment used to handle the cargo to which the requirements in this Part apply for once or more are, as a rule, to be stored in the lockers provided within the cargo area. One set of these is , to be stored in the locker near the cargo pump room at all times. The construction of the special locker for the storage of protective equipment provided in the cargo area is to comply with the requirement in **Chapter 19, Part C of the Rules**. When this can not be complied with under avoidable reasons, protective equipment may be stored in the store or locker having no openings to accommodation space and service space and located outside the cargo area as shown in **Fig. S14.1.2-1**. This requirement does not apply to brand new protective equipment, unused equipment, or equipment which has not been used since undergoing a through cleaning process.	Reference correction

Table 7-1-A1 Interpretation of *SOLAS* II-2

Number	*SOLAS*	Interpretation
5.3.2.2	Combustible materials used on the surfaces and linings specified in paragraph **3.2.1** ***shall have a calorific value not exceeding*** $45MJ/m^2$ ***of the area for the thickness used.**** The requirements of this paragraph are not applicable to the surfaces of furniture fixed to linings or bulkheads.	*: The fire retardant veneers specified in **R5.3.2-2, Part R of the ~~Rules~~Guidance for the Survey and Construction of Steel Ships**, whose thickness is not more than 1 *mm*, are considered to be corresponding this regulation.
7.5.3	There shall be installed throughout each separate zone, whether vertical or horizontal, in all accommodation and service spaces and, ***where it is considered necessary by the Administration****1, in control stations, except ***spaces which afford no substantial fire risk****2 such as void spaces, sanitary spaces, etc., ***either****3: .1 a fixed fire detection and fire alarm system so installed and arranged as to detect the presence of fire in such spaces and providing smoke detection in corridors, stairways and escape routes within accommodation spaces. Detectors fitted in cabins, when activated, shall also be capable of emitting, or cause to be emitted, an audible alarm within the space where they are located; or .2 an automatic sprinkler, fire detection and fire alarm system of an approved type complying with the relevant requirements of the Fire Safety Systems Code and so installed and arranged as to protect such spaces and, in addition, a fixed fire detection and fire alarm system and so installed and arranged as to provide smoke detection in corridors, stairways and escape routes within accommodation spaces.	*1: The control stations which the crews are not always stationed (steering room is generally considered as the space which crews are always stationed) and the cargo spaces which are usually inaccessible (the cargo spaces are to be provided with fire detection) are applicable to the case. *2: "Spaces which afford no substantial fire risk" are to include deckhouses and boatswain's store which are separated from accommodation spaces (the spaces which are separated from accommodation space by cargo space, special category space or machinery space, or the spaces which main vertical zones are installed in the boundary between accommodation space and which have no direct access from the accommodation space at all). And, "sanitary space" means lavatories, baths, showers, small laundry rooms, etc. *2: Storage rooms for gas bottles of gaseous fuel systems and gas welding equipments where complying with the provisions of **R4.3.1-3** or **R4.3.2-4, Part R of the Guidance for the Survey and Construction of Steel Ships**, may be regarded as those on open deck and are to be treated as the exclusion from application of regulation II-2/7.5.3. *3: Where "either system" is installed, either one system is to be installed in one horizontal zone (the horizontal zone defined by interpretation of regulation II-2/9.2.2.3.2) without being mixed regulation II-2/7.5.3.1 with regulation II-2/7.5.3.2 in principle. *3: The effective automatic sprinkler system and smoke detection system are to be installed in the whole area of the

			atrium.		
	9.2.2.3.2 Note	Note: To be applied to ~~t~~**Table 9.1** to **9.2**, as appropriate. a Where adjacent spaces are in the same numerical category and superscript "a" appears, a bulkhead or deck between such spaces ***need not be fitted***[*21] if deemed unnecessary by the Administration. For example, in category (12) a bulkhead not be required between a galley and its annexed pantries provided the pantry bulkhead and decks maintain the integrity of the galley boundaries. A bulkhead is, however, required between a galley and machinery space even though both spaces are in category (12). b The ship's side, to the waterline in the lightest seagoing condition, superstructure and deckhouse sides situated below and adjacent to ***liferafts***[*22] and evacuation sides may be reduced to "*A-30*". c Where public toilets are installed completely within the stairway enclosure, the public toilet bulkhead within the stairway enclosure can be of "*B*" class integrity. d ***Where spaces of category (6), (7), (8) and (9) are located completely within the outer perimeter of the assembly station***[*23], the bulkheads of these spaces are allowed to be of "*B-0*" class integrity. Control positions for audio, video and light installations may be considered as part of the assembly station.	*21: If bulkheads or decks are installed in these spaces, these are to be of "*C*" class boundaries. *22: These are to include not only liferafts but also lifeboats. *23: If the perimeter is arranged at the inside (this arrangement is not permitted to Ro-Ro passenger ships), fire insulation value of boundaries of this perimeter may be lighter than the value of outside perimeter.		
	9.2.2.4.2 Note	Notes: To be applied to both **Tables 9.3** and **9.4**, as appropriate. a For clarification as to which applies, see paragraph **2.2.2** and **2.2.5**. b Where spaces are of the same numerical category and superscript *b* appears, ***a bulkhead or deck of the ratings shown in the table is only required when the adjacent spaces are for a different purpose***[*3], (e.g. in category (9)). A galley next to a galley does not require a bulkhead, but a galley next to a paint room requires an "*A*-0"	*3: If bulkheads and decks are installed in spite of being not required, these are to be of "*C*" class boundaries.		

		bulkhead. c ***Bulkheads separating the wheelhouse and chartroom from each other may have a "B-0" rating.***[*4] No fire rating is required for those partitions separating the navigation bridge and the safety centre when the latter is within the navigation bridge. d See paragraphs **2.2.4.2.3** and **2.2.4.2.4.** e For the application of Regulation **2.2.1.1.2**, "*B*-0" and "*C*", where appearing in **~~t~~Table 9.3**, shall be read as "*A*-0". f Fire insulation need not be fitted ***if the machinery space of category (7), in the opinion of the Administration, has little or no fire risk.***[*5] g Ships constructed before 1 July 2014 shall comply, as a minimum, with the previous requirements applicable at the time the ship was constructed, as specified in regulation **1.2**. * Where an asterisk appears in the tables, the division is required to be of steel or other equivalent material, but is not required to be of "*A*" class standard. However, where a deck, except in a category (10) space, is penetrated for the passage of electric cables, pipes and vent ducts, such penetrations should be made tight to prevent the passage of flame and smoke. Divisions between control stations (emergency generators) and open decks may have air intake openings without means for closure, unless a fixed gas fire-extinguishing system is fitted. For the application of paragraph **2.2.1.1.2**, an asterisk, where appearing in **~~t~~Table 9.4**, except for categories (8) and (10), shall be read as "*A*-0".	*4: A navigation locker that can only be accessed from the wheelhouse is to be considered as a control station, and Note c may be applied. *5: See the definitions of (10) of regulation **II-2/9.2.2.3.2**.		
	13.4.1.1	Where the space is below the bulkhead deck the two means of escape shall consist of either: .1 two sets of ***steel ladders***[*1] as widely separated as possible, leading to doors in the upper part of the space similarly separated and from which access is provided to the appropriate lifeboat and liferaft embarkation decks. One	*1: Ladders having strings of flexible steel wire ropes are not acceptable in such escape routes. *2: A "safe position" can be any space, excluding lockers and storerooms irrespective of their area, cargo spaces and		

		of these ladders shall be located within a protected enclosure that satisfies regulation **9.2.2.3**, category (2) or regulation **9.2.2.4**, category (4), as appropriate, from the lower part of the space it serves to a ***safe position***[*2] outside the space. Self-closing fire doors of the same fire integrity standards shall be fitted in the enclosure. The ladder shall be fixed in such a way that heat is not transferred into the enclosure through non-insulated fixing points. The ***protected enclosure***[*3, *4] shall have minimum internal dimensions of at least 800*mm* x 800*mm*, and shall have emergency lighting provisions; or .2 one steel ladder leading to a door in the upper part of the space from which access is provided to the embarkation deck and additionally, in the ***lower part of the space***[*5] and in a position well separated from the ladder referred to, a steel door capable of being operated from each side and which provides access to a safe escape route from the lower part of the space to the embarkation deck.	spaces where flammable liquids are stowed, but including special category spaces and ro-ro spaces, from which access is provided and maintained clear of obstacles to the embarkation decks. *3: Refer to **R13.4.1-10, Part R of the Guidance for the Survey and Construction of Steel Ships**. *4: Internal dimensions are to be interpreted as clear width, so that a passage having diameter of 800 *mm* is available throughout the vertical enclosure, as shown in the **Fig. R13.4.1-2**, clear of ship's structure, with insulation and equipment, if any. The ladder within the enclosure can be included in the internal dimensions of the enclosure. When protected enclosures include horizontal portions their clear width is not to be less than 600 *mm*. *5: Machinery spaces may include working platforms and passageways, or intermediate decks at more than one deck level. In such case, the lower part of the space is to be regarded as the lowest deck level, platform or passageway within the space. At deck levels, other than the lowest one, where only one means of escape other than the protected enclosure is provided, self-closing fire doors are to be fitted in the protected enclosure at that deck level. Smaller working platforms in-between deck levels, or only for access to equipment or components, need not be provided with two means of escape.		

Guidance for the Survey and Construction of Passenger Ships Annex 7-1 Table 7-1-B1

Correction	Present	Note
Table 7-1-B1 Interpretations of FSS Code		Reference correction

Table 7-1-B1 Interpretations of FSS Code

Number	*FSS* Code	Interpretations
FSS 4.3.1.1.1	Each powder or carbon dioxide extinguisher shall have a capacity of at least 5*kg* and each foam extinguishers shall have a capacity of at least 9*l*. The mass of all portable fire extinguishers shall not exceed 23*kg* and they shall have a fire-extinguishing ***capability at least equivalent**** to that of a 9*l* fluid extinguisher.	*: Fire extinguishers are to be in accordance with requirements of **R24.2.1, Part R of the Guidance for the Survey and Construction of Steel Ships**. The types and specific use of extinguishers are to be as given in **Table R10.3.2-~~2~~1, Part R of the Guidance for the Survey and Construction of Steel Ships.**
FSS 5.2.1.3.2	Means shall be provided for automatically giving audible and visual warning of the release of fire-extinguishing medium into any ro-ro spaces, container holds equipped with integral reefer containers, spaces accessible by doors or hatches, and other spaces in which personnel normally work or to which they have access. The audible alarms shall be located so as to be audible throughout the protected space with all machinery operating, and the alarms should be distinguished from other audible alarms by adjustment of sound pressure or sound patterns. The pre-discharge alarm shall be automatically activated (e.g., by opening of the release cabinet door). The alarm shall operate for the length of time needed to evacuate the space, but in no case less than 20 *s* before the medium is released. ***Conventional cargo spaces**** and small spaces (such as compressor rooms, paint lockers, etc.) with only a local release need not be provided with such an alarm.	*: Refer to **R25.2.1-7, Part R of the Guidance for the Survey and Construction of Steel Ships** for the definition of "conventional cargo spaces".
FSS 9.2.3.1.3	Heat detectors shall be certified to operate before the temperature exceeds 78℃ but not until the temperature exceeds 54℃, when the temperature is raised to those limits at a rate less than 1℃ per *min*, when tested according to standards *EN* 54:2001 and *IEC* 60092-504. Alternative testing standards may be used as determined by the Administration. At higher rates of temperature rise, the heat detector shall operate within ***temperature limits**** to the satisfaction of the Administration having regard to the avoidance of detector insensitivity or oversensitivity.	*: The "temperature limit" is to comply with **R29.2.3-1(3), Part R of the Guidance for the Surveys and Construction of Steel Ships** for constant temperature type spot detectors and compensation type spot detectors.

Guidance for the Survey and Construction of Passenger Ships Annex 7-2 1.1.2-1

Correction	Present	Note
1 In considering the design of stairway widths for each individual case which allow for the timely flow of persons evacuating to the muster stations from adjacent decks above and below, the following calculation method should be used (*see* **Fig. 7-2-1** and **Fig. 7-2-2**): when joining two decks: $W = (N1+N2)\times 10$ *mm*; when joining three decks: $W = (N1+N2 + 0.5\times N3)\times 10$ *mm*; when joining four decks: $W = (N1+N2 + 0.5\times N3 + 0.25\times N4)\times 10$ *mm*; when joining five or more decks the width of the stairways should be determined by applying the above formula for four decks to the deck under consideration and to the consecutive deck, where: W = the required tread width between handrails of the stairway. The calculated value of "W" may be reduced where available landing area "S" is provided in stairways at the deck level defined by subtracting "P" from "Z", such that: $P = S\times 3.0$ persons/m^2; $P_{\max} = 0.25\ Z$ where: Z = the total number of persons expected to be evacuated on the deck being considered; P = the number of persons taking temporary refuge on the stairway landing, which may be subtracted from "Z" to a maximum value of $P = 0.25\ Z$ (to be rounded down to the nearest whole number); S = the surface area (m^2) of the landing, minus the surface area necessary for the opening of doors	**1** In considering the design of stairway widths for each individual case which allow for the timely flow of persons evacuating to the muster stations from adjacent decks above and below, the following calculation method should be used (*see* **Fig. 7-2-1** and **7-2-2**): when joining two decks: $W = (N1+N2)\times 10$ *mm*; when joining three decks: $W = (N1+N2 + 0.5\times N3)\times 10$ *mm*; when joining four decks: $W = (N1+N2 + 0.5\times N3 + 0.25\times N4)\times 10$ *mm*; when joining five or more decks the width of the stairways should be determined by applying the above formula for four decks to the deck under consideration and to the consecutive deck, where: W = the required tread width between handrails of the stairway. The software is to be suitable for diagnosing the condition of equipment or its components on the basis of independent or coalesced data, or their trends. (d) The condition monitoring system is to produce condition monitoring records. (e) In cases where condition monitoring and diagnosis are conducted on board ships, the condition monitoring system is to be such that no specialized knowledge of data analysis is required to use the system. (f) In cases where remote condition monitoring and	is to be approved by the Society. (a) The computer collects data from sensors or centralized machinery monitoring and control systems. The sensors are to be subject to the tests equivalent to those specified in **18.7.1, Part D of the Rules for the Survey and Construction of Steel Ships**. (b) The hardware and software of the computer is to comply with **9.1.3-4(5)(a)** to **(e)** and **Chapters 1, 2 and 3, Part X of the Rules for the Survey and Construction of Steel Ships**. (c) In addition to **(b)**, the software is to have condition monitoring function specified in **Annex B9.1.3-4 “Procedures for approval of PMS/CBM management software”, Part B of the Guidance for the Survey and Construction of Steel Ships** and be suited to diagnosing any deterioration of machinery, equipment or associated components on the basis of the data from the sensors or centralized machinery monitoring and control systems specified in **(a)**. The software is to be suitable for diagnosing the condition of equipment or its components on the basis of independent or coalesced data, or their trends. (d) The condition monitoring system is to produce condition monitoring records. (e) In cases where condition monitoring and diagnosis are conducted on board ships, the	

diagnosis are conducted (i.e. the data sent from the ship is analyzed remotely), the condition monitoring systems are to include a communication function to transfer the data collected by the sensors or centralized machinery monitoring and control systems specified in **(a)**. Particular attention is to be paid to the cyber safety and security of said communication function. The system equipped on board is to be arranged to store the condition monitoring data in the event of loss of the communication function and transfer the data after the communication function is restored. (g) In cases where limiting parameters are modified, such modifications are to be identified. (h) The condition monitoring system is to include a method for backing up data at regular intervals. (3) Maintenance management system The maintenance management system is to have the maintenance records function specified in **Annex ~~B9~~9.1.3~~-4 "Procedures for approval of PMS/CBM management software"~~, Part B of the ~~Guidance~~Rules for the Survey and Construction of Steel Ships**. This function may be incorporated into the condition monitoring system specified in **(2)**. (4) Survey Schedule Table Annual surveys are to be performed to confirm that the machinery maintenance scheme for CBM is being properly implemented. In cases where there is any damage to the machinery, equipment or associated components subject to the scheme or an abnormality is found in the results of condition monitoring and diagnosis, the shipowner (or ship management company) is to promptly report this to the Society and	condition monitoring system is to be such that no specialized knowledge of data analysis is required to use the system. (f) In cases where remote condition monitoring and diagnosis are conducted (i.e. the data sent from the ship is analyzed remotely), the condition monitoring systems are to include a communication function to transfer the data collected by the sensors or centralized machinery monitoring and control systems specified in **(a)**. Particular attention is to be paid to the cyber safety and security of said communication function. The system equipped on board is to be arranged to store the condition monitoring data in the event of loss of the communication function and transfer the data after the communication function is restored. (g) In cases where limiting parameters are modified, such modifications are to be identified. (h) The condition monitoring system is to include a method for backing up data at regular intervals. (3) Maintenance management system The maintenance management system is to have the maintenance records function specified in **Annex B9.1.3-4 "Procedures for approval of PMS/CBM management software", Part B of the Guidance for the Survey and Construction of Steel Ships**. This function may be incorporated into the condition monitoring system specified in **(2)**. (4) Survey Schedule Table Annual surveys are to be performed to confirm that the machinery maintenance scheme for CBM is being properly implemented. In cases where there is any damage to the machinery, equipment or associated	

apply for an occasional survey if instructed to do so by the Society. When this survey schedule table is amended, the amended survey schedule table is to be submitted to the Society for approval. (5) Condition monitoring record Condition monitoring records are to include at least the following items. (a) Condition monitoring data, including all data since last open-up inspection, the original baseline data specified in **-6(2)** and relevant maintenance data. (b) Signature of the chief engineer. (c) Contents and results of condition monitoring and diagnosis (including criteria for judgment). (6) Machinery maintenance record The machinery maintenance records are to include the items specified in **9.1.3-4(3)** for the machinery, equipment or associated components subject to the scheme. Those records are to be created by the chief engineer and always to be available on board the ship. (7) Chief engineer and other ship personnel The machinery maintenance scheme for CBM is to be implemented by a chief engineer designated by the shipowner or ship management company. Access to the condition monitoring system and maintenance management system is to be permitted only to the chief engineer and other ship personnel who are designated by the shipowner or ship management company.	components subject to the scheme or an abnormality is found in the results of condition monitoring and diagnosis, the shipowner (or ship management company) is to promptly report this to the Society and apply for an occasional survey if instructed to do so by the Society. Correction	Present	Note
6 Surveys of CBM (1) Installation survey It is to be confirmed in the presence of the Surveyor that the equipment necessary for condition monitoring and diagnosis, e.g. sensors, are installed and available in accordance with the machinery maintenance scheme for CBM. In addition, a set of baseline readings is to be taken. (2) Implementation survey An implementation survey is to be carried out no earlier than 6 months after the installation survey and no later than the first periodical survey (i.e. the Annual Survey, Intermediate Survey or Special Survey specified in **1.1.2-2, Part 2 of the Rules**). At the implementation survey the following **(a)** to **(f)** are to be verified. At this implementation survey, a report which specifies the implementation status of these items is to be submitted to the Society. The baseline data are to be approved by the Society prior to the implementation survey (a) Baseline data are incorporated in the condition monitoring system. (b) Condition monitoring and maintenance are conducted in accordance with the machinery maintenance scheme for CBM (including a comparison of condition monitoring results to the baseline data). (c) Condition monitoring records and machinery maintenance records are available on board the ship and the contents of said records are sufficient as an alternative to the open-up surveys specified in **Table 2.9.1, Part 2**~~, Chapter 9~~ **of the Rules**.	**6** Surveys of CBM (1) Installation survey It is to be confirmed in the presence of the Surveyor that the equipment necessary for condition monitoring and diagnosis, e.g. sensors, are installed and available in accordance with the machinery maintenance scheme for CBM. Correction	Present	Note
Table 7.1.1.5-1 Kinds of Auxiliaries		Reference correction

Kind of auxiliary		Auxiliary machinery items
Auxiliary Machinery essential for main propulsion	Auxiliary machinery for cooling systems	Jacket cooling water pumps, Piston cooling water (oil) pumps, Fuel valve cooling water (oil) pumps, Turbocharger cooling water pumps, Circulating water pumps, Cooler cooling water pumps, Generator engine cooling water (oil) pumps, Air compressors cooling water pumps
	Auxiliary machinery for feed water, condensate and draining systems	Boiler water circulating pumps, Condensate pumps, Exhaust gas economizer feed pumps, Drain pumps, Feed water pumps
	Auxiliary machinery for fuel oil systems	F.O. supply (service) pumps, F.O. transfer pumps, Boiler burning pumps, F.O. purifiers
	Auxiliary machinery for lubricating oil systems	Cam shaft L.O. pumps, Turbocharger L.O. pumps, Crosshead L.O. pumps, Reduction gear L.O. pumps, Stern tube L.O. pumps (not applicable for gravitational circulation systems), L.O. purifiers

	Auxiliary machinery for hydraulic systems	Hydraulic oil pumps (pumps to supply hydraulic oil to hydraulic circuits for driving or controlling equipment relevant to main propulsion, e.g., controllable pitch propeller oil pumps)
	Other auxiliary machinery	Boiler draught fans, Air compressors (excluding air compressors for emergency use), Distilling plants (when distillate is used for essential boilers), Others as deemed essential by the Society.
Auxiliary machinery for manoeuvring and safety	Pumps	Bilge pumps (including pumps for oil-water separators*), Ballast pumps, Fire pumps*
	Steering-related auxiliary machinery	Steering engines, Side thrusters*, Stabilizers
	Deck machinery	Windlasses, Mooring winches*, Hydraulic pumps used for windlasses, Hydraulic pumps used for mooring winches*
	Ventilating fans, blowers, etc.	Ventilating fans (installed in hazardous areas due to flammable gases or gases harmful to the health of personnel in engine room*, boiler room*) Others as deemed essential by the Society.
Auxiliary machinery for cargo handling	Cargo handling machinery and gear	Hydraulic pumps used for Cargo handling appliances (items subject to “Rules for the Survey and Construction of Cargo Handling Appliances of Ships”), Hoisting machinery, Operating equipment
	Other auxiliary machinery	Others as deemed essential by the Society
Auxiliary machinery for specific use	Cargo handling equipment for specific Use	Unloaders (Shipborne units), Refrigerating machines for heat insulated containers, etc.
	Public working equipment	Dredging equipment, Drilling machines, Pile-driving equipment, etc.
	Fishing equipment	Winches, etc.
	Marine-products processing equipment	Canning/packing equipment, Conveyors, Ice-making machines, etc.
	Equipment for specific operations	Equipment specifically designated by the Society

Remarks:

For those items of auxiliary machinery marked by an asterisk, *see* ~~7.~~**1.1.4(4)**

Correction	Present	Note
Tests on simulated inner bottom conditions in cargo oil tanks (COT) are to satisfy each of the following conditions. (1) The test is to be carried out for 72 h for base metal, and 168 h for welded joint. (2) There are to be at least five test pieces of corrosion resistant steel for base metal and welded joint, respectively. For comparison, at least five test pieces of base metal of conventional steel should be tested in the same condition. (3) The size of each test piece is 25 ± 1 *mm* x 60 ± 1 *mm* x 5 ± 0.5 *mm* for a specimen with base metal only, and is 25 ± 1 *mm* x 60 ± 1 *mm* x 5 ± 0.5 *mm* for a specimen with welded joint including 15 ± 5 *mm* width of weld metal part as shown in ~~**Figure**~~**Fig. 1.1-3**. The surface of the test pieces is to be polished with an emery paper #600, except a hole for hanging. (4) The samples are hung in a solution from a fishing line (0.3 *mm* to 0.4 *mm* in diameter, made of nylon) to avoid crevice-like and/or localized corrosion. An example of a corrosion test configuration is shown in ~~**Figure**~~**Fig. 1.1-4**. (5) The test solution contains 10 mass% $NaCl$ and its pH is 0.85 adjusted by HCl solution. The test solution should be changed to a new one every 24 h to minimize pH change of the test solution. The volume of the solution is more than 20 cc/cm^2 (surface area of test piece). The temperature of the test solution is to be kept at 30 ± 2°C.	Tests on simulated inner bottom conditions in cargo oil tanks (COT) are to satisfy each of the following conditions.
