

Standardisation of Terminology Used for Yield Strength Standards

Object of Amendment

Rules for the Survey and Construction of Steel Ships Parts K and M
Guidance for the Survey and Construction of Steel Ships Part K

Reason for Amendment

Standards for mechanical properties of metallic materials and welded joints are specified in Parts K and M of the Rules for the Survey and Construction of Steel Ships. In addition, methods for determining yield strength values through tensile tests according to whether yield phenomena exist, and tables related to yield strength standards are specified.

The aforementioned tables, however, are not standardised, and various terms, such as “yield stress”, “yield point”, “proof stress” or “proof strength”, are used to describe “yield strength”.

Accordingly, relevant requirements are amended to standardise the terminology used for yield strength standards.

Outline of the Amendment

The main details of this amendment are as follows:

- (1) Amends relevant requirements to, in principle, refer to standards for the yield strength of metallic materials and welded joints as “yield point or proof stress”.
- (2) Amends relevant requirements for metallic materials for which it is clear that the yield strength is measured by 0.2 % proof stress to refer to standards for yield strength as “proof stress”.

Effective Date and Application

Effective date of this draft amendment is [the date of establishment].

An asterisk (*) after the title of a requirement indicates that there is also relevant information in the corresponding Guidance.

ID:DH24-11
