

Strength Evaluation of Container Stowage and Securing Arrangements

Object of Amendment

Rules for the Survey and Construction of Steel Ships Parts A, B, C and CS

Reason for Amendment

In line with recent trends, such as the increase in the volume of freight containers being transported and the interest in ensuring that they are transported safely, expectations and demands for safety standards and strength assessments of container stowage and securing arrangements have increased.

The Society, therefore, published its “Guidelines for Container Stowage and Securing Arrangements”, which provides a general guideline for the stowage and securing of containers. This Guidelines has been revised several times over the years for the purpose of incorporating the latest knowledge and feedback related to its practical application.

Relevant requirements for strength evaluation of container stowage and securing arrangements are, therefore, specified based on “Guidelines for Container Stowage and Securing Arrangements” and the results of recent research.

Outline of the Amendment

The main contents of this amendment are as follows:

- (1) Specify requirements for strength evaluation of container stowage and securing arrangements in 14.3, Part 2-1, Part C.
- (2) Specify requirements for the safe design for container lashing operations in 14.4, Part 2-1, Part C.

Effective Date and application

1. This amendment applies to ships for which the date of contract for construction is on or after 1 July 2027.
2. Notwithstanding the preceding 1, this draft amendment may apply, upon request, to ships for which the date of contract for construction is before the effective date.

An asterisk (*) after the title of a requirement indicates that there is also relevant information in the corresponding Guidance.

ID:DH25-06

14.3.1.2 Application

For container carriers engaged in international voyages, the container securing arrangement plan specified in 14.2.5.1 is to comply with the strength evaluation of container stowage and securing arrangements specified in 14.3.

(Newly added)

14.3.1.3 Assumptions

1 The following (1) to (8) assumptions are made in the strength evaluation specified in 14.3.

- (1) Excessive ship motions, such as parametric rolling, are not taken into account.
- (2) Ship motions and wave environments exceeding those specified for the strength evaluation are not taken into account.
- (3) Containers are stowed so that the longitudinal edge of

(Newly added)

Correspond to Chapter 1, "Guidelines for Container Stowage and Securing Arrangements".

| <p><u>x, y and z</u>: The coordinates of the centre of the gravity of a container. The vertical distance h_{cg} (m) from bottom of a container to the centre of the gravity of the container is to be calculated from the following formula and taken as the standard.</p> $h_{cg} = 0.33h_{con}$ <p><u>h_{con}</u>: Height of container (m)</p> <p><u>θ and ϕ</u>: As specified in 4.2.2, Part 1: the values for the maximum load condition are to be applied.</p> <p><u>x_G</u>: X-coordinate of the centre of gravity of the ship (m), to be obtained from the following formula. However, values calculated in consideration of loading conditions may be applied instead.</p> $x_G = (0.36 + 0.2C_{B_LC})L_C$ <p><u>z_G</u>: Z-coordinate of the centre gravity of the ship (m) for the loading condition under consideration.</p> <p><u>GM</u>: Metacentric height (m): the value⁽²⁾ for the loading condition under consideration, which is described in the loading manual, is to be adopted.</p> <p><u>λ_{AV}</u>: As specified in Table 4.3.2-5, Part 2-9, Part C.</p> <p>(1) Notwithstanding 1.4.3.6, Part 1, vertical force is defined as positive when the load acts downward.</p> <p>(2) GM is not to be less than $0.002B^2$.</p> | (Newly added) | Correspond to 5.5, "Guidelines for Container Stowage and Securing Arrangements". |

14.3.2.3 Wind Loads Acting on Containers

1 In the strength evaluation of container stowage and securing arrangements on deck, where wave condition $LC1$ or $LC3$ is considered, the wind loads acting on containers specified in 14.3.2.3 are to be considered in addition to loads specified in Table 14.3.2-1.

2 Wind loads are considered to act on containers only in the transverse direction of such containers.

3 Wind loads are considered to act only on containers stowed in outboard stacks.

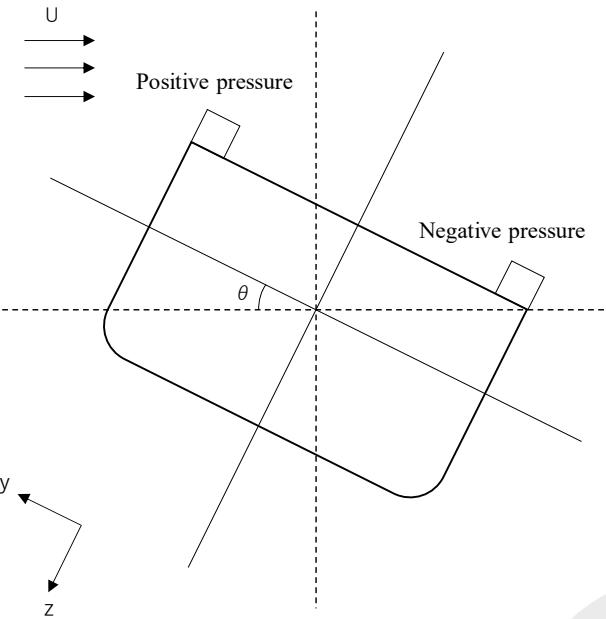

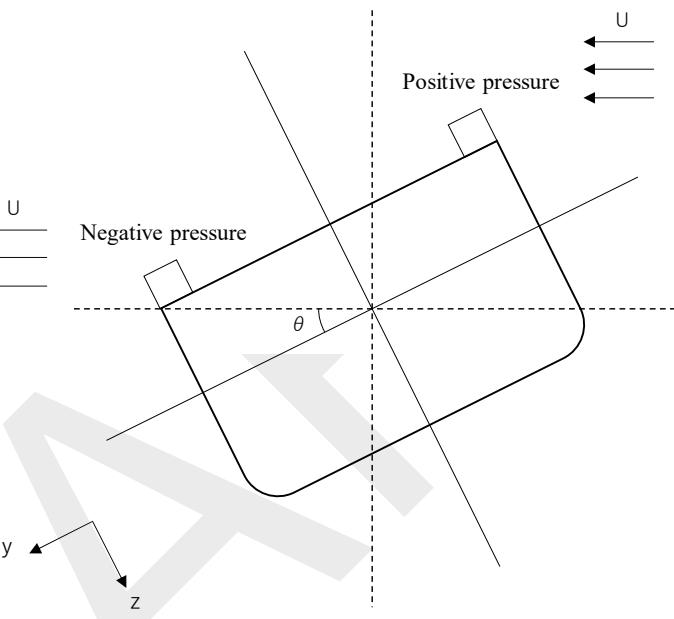

4 Wind loads acting on containers are to be in accordance with the following (1) and (2).

(1) The wind pressure acting on a container P_{wind} (kN/m^2) is to be in accordance with the following formula.

Amended-Original Requirements Comparison Table (Strength Evaluation of Container Stowage and Securing Arrangements)

Amended-Original Requirements Comparison Table (Strength Evaluation of Container Stowage and Securing Arrangements)

| Amended | Original | Remarks |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|---------|
| <p><u>An3.3.1</u> are to be a representation of the sea conditions encountered by ships in the assumed route and months of navigation. In addition, at least two variables, significant wave height and wave period, are to be included in the wave scatter diagrams.</p> | | |
| <p><u>2</u> In applying <u>-1</u> above, a sufficient amount of short-term sea state data is to be included in the wave scatter diagrams in order to obtain long-term predicted values for 25 years. The fundamental data used for establishing the wave scatter diagrams is to cover a sufficient period. With respect to sea state data, which is one of the fundamental data types, data provided by an appropriate organisation or company is to be used. The accuracy of the data is to be verified, and attention must be paid to the influence of factors not considered in the construction of the sea state data. In addition, when estimating the sea conditions encountered by ships, the ship position data must be representative of the ship positions corresponding to the target ship type and size.</p> | | |
| <p>An3.4.2 Standard Method</p> <p><u>1</u> The sea conditions encountered by ships are, in principle, to be statistically processed by modelling the probability distribution of significant wave height and the conditional distribution of wave period on significant wave height. In fitting a statistical distribution to the fundamental data, sufficient attention is to be paid to the fitting accuracy. In this regard, it is common practice to refer to the likelihood function or Q-Q plots. Furthermore, in order to avoid overfitting, it is recommended that the number of parameters in the statistical model be kept only to those necessary and sufficient, such as by referring to information criteria. In addition, in order to evaluate the uncertainty inherent in the fundamental data, it is recommended to assess the confidence intervals of the parameters obtained by statistical analysis.</p> | | |

| <p><u>2</u> In modelling the probability distribution of significant wave height, attention is to be paid to meteorological conditions that result in high waves (storms). It is recommended that statistical processing be performed after distinguishing between the types of meteorological phenomena that generate storms, such as extratropical cyclones, tropical cyclones and monsoons.</p> <p><u>3</u> In statistically analysing the sea conditions encountered, the sea area is to be appropriately divided, and a wave scatter diagram is to be established for each such sea area subdivision. The sea area subdivisions are to take into consideration the characteristics of the waves in the area and the geographical distribution of navigation traffic. Examples of sea area subdivisions are shown in Fig. An2.</p> | | |

| <p><u>Annex14.3B CALCULATION OF TENSION ACTING ON LASHING RODS</u></p> <p><u>An1. General</u></p> <p><u>An1.1 General</u></p> <p><u>An1.1.1 Overview</u></p> <p><u>1</u> This Annex specifies a method for the calculation of tension acting on lashing rods when evaluating the parts of containers and securing fittings in accordance with 14.3.</p> <p><u>2</u> Flowcharts for calculations of linear and non-linear tension acting on the lashing rods are shown in Fig. An1.</p> <p><u>3</u> In calculating the loads acting on the parts of containers and securing fittings, racking deformation in the longitudinal direction on side walls of containers and racking deformation in the transverse direction on end walls are to be considered. The loads acting on the parts and securing fittings are to be calculated for both door ends and closed ends walls of the containers in wave conditions LC1 and LC3 since the stiffness of the container stack differs between door ends and closed ends walls.</p> | <p>(Newly added)</p> | |
